Global smooth solutions of Euler equations for Van der Waals gases

Magali Mercier*

March 11, 2010

Abstract

We prove global in time existence of solutions of the Euler compressible equations for a Van der Waals gas when the density is small enough in \mathbf{H}^m , for m large enough. To do so, we introduce a specific symmetrisation allowing areas of null density. Next, we make estimates in \mathbf{H}^m , using for some terms the estimates done by M. Grassin, who proved the same theorem in the easier case of a perfect polytropic gas. We treat the remaining terms separately, due to their non-linearity.

2000 Mathematics Subject Classification: 35L60, 35Q31, 76N10.

Keywords: Euler compressible equations, smooth solutions, special symmetrisation.

1 Introduction

We are interested in the Cauchy problem for Euler compressible equations, describing the evolution of a gas whose thermodynamical and kinetic properties are known at time $t = 0$.

More specifically, we are concerned with the life span of smooth solutions. Various authors, in particular T. C. Sideris [20, 21], T. Makino, S. Ukai & S. Kawashima [13], J.-Y. Chemin [2, 3] have given criteria for mathematical explosion. We know also that there exist global in time solutions for well chosen initial data. Li Ta Tsien [12], D. Serre [19], M. Grassin [7] prove for example the global in time existence of regular solutions under some hypotheses of “expansivity”.

Most of these results were obtained within the framework of Perfect Polytropic Gases. A natural question is to determine whether these results extend to more realistic gases, following for example the Van der Waals law. This law takes into account the volume of molecules, which is important in physical situations like explosions or implosions. In such limits, the gas is highly compressed and the Van der Waals law fits better with the behaviour of real gases than the Perfect polytropic gases in such limits. The Van der Waals law is also used to modelise dusty gases, seen as perfect gases with dust pollution [8, 16, 22, 24]. This law is given by the relationship

$$p(v - b) = \Re T,$$

*Université de Lyon, Université Lyon 1, École centrale de Lyon, INSA de Lyon, CNRS, UMR5208, Institut Camille Jordan, 43 blvd du 11 novembre 1918, F-69622 Villeurbanne-Cedex, France

where p is the pressure, v the massic volume, T the temperature and b, \mathfrak{R} are given constants.

The addition of the covolume b , representing the compressibility limit of the molecules in the gas, modifies non-trivially the analysis of the Euler equations. However, we are going to show the global in time existence of regular solutions thus generalising a theorem of M. Grassin [7].

Theorem 1.1. *Let $m > 1 + d/2$. Let (ρ_0, u_0, s_0) be the initial conditions for the Cauchy problem associated to the Euler compressible equations (2.1) for a Van der Waals gas with constant c_v and $c_v > 0$. Let us assume $0 \leq \rho_0 \leq 1/b$. Then we can define $\gamma_0 = 1 + \frac{\mathfrak{R}}{c_v}$; furthermore there exists $\varepsilon_0 > 0$ such that if*

- (H1) $\|(\pi_0, s_0)\|_{\mathbf{H}^m(\mathbb{R}^d)} \leq \varepsilon_0$, where $\pi_0 = \left(\frac{\rho_0}{1-b\rho_0}\right)^{\frac{\gamma_0-1}{2}} \exp(\frac{s_0}{c_v})$,
- (H2) the initial speed u_0 belongs to the space $X = \{z : \mathbb{R}_+ \times \mathbb{R}^d \rightarrow \mathbb{R}^d; Dz \in \mathbf{L}^\infty, D^2 z \in \mathbf{H}^{m-1}\}$,
- (H3) there exists $\delta > 0$ such that for all $x \in \mathbb{R}^d$, $\text{dist}(\text{Spec}(Du_0)(x), \mathbb{R}_-) \geq \delta$,
- (H4) the initial density ρ_0 and the initial entropy s_0 have compact support,

then the problem

$$\begin{cases} \partial_t \bar{u} + (\bar{u} \cdot \nabla) \bar{u} &= 0 & \text{on } \mathbb{R}_+ \times \mathbb{R}^d, \\ \bar{u}(0, x) &= u_0(x) & \text{on } \mathbb{R}^d. \end{cases} \quad (1.1)$$

admits a global classical solution. If furthermore $\gamma_0 = \frac{\nu+1}{\nu-1}$ with $\nu \in \mathbb{N}$ and $\nu \geq 2$, or if γ_0 and m satisfy $\nu = \frac{\gamma_0+1}{\gamma_0-1} \geq m > 1 + \frac{d}{2}$, then there exists a global classical solution (ρ, u, s) to the Euler compressible equations (2.1) satisfying

$$\left(\left(\frac{\rho}{1-b\rho}\right)^{\frac{\gamma_0-1}{2}}, u - \bar{u}, s\right) \in \mathcal{C}^0(\mathbb{R}_+; \mathbf{H}^m(\mathbb{R}^d; \mathbb{R}^{d+2})) \cap \mathcal{C}^1(\mathbb{R}_+; \mathbf{H}^{m-1}(\mathbb{R}^d; \mathbb{R}^{d+2})).$$

To do so, we have first to extend to Van der Waals gases a symmetrisation obtained by Makino, Ukai & Kawashima [13], which allows null density areas. Next we will derive energy estimates in \mathbf{H}^m .

Since the Van der Waals gases have a behaviour close to perfect polytropic gases for weak densities, this result is not much surprising. However, the non linear terms introduced by the Van der Waals law have to be treated carefully.

In Section 2, we describe the thermodynamic properties of a compressible gas and we state some important properties such as the Friedrichs' symmetrisation. In Section 3, we give the detailed proof of this result and in Section 4 we give the proofs of some technical lemmas used in Section 3.

2 Thermodynamic and first properties

2.1 Conservation law

Compressible fluid dynamics, without viscosity or heat transfer, is described by the Euler equations, which are made of the conservation of mass, of momentum and of energy (see

[5, chap. 2]) :

$$\begin{cases} \partial_t \rho + \operatorname{div}(\rho u) = 0, \\ \partial_t q + \operatorname{div}(\rho u \otimes u) + \nabla p = 0, \\ \partial_t E + \operatorname{div}((E + p)u) = 0, \end{cases} \quad (2.1)$$

where ρ is the mass of the fluid per unit of volume, $q = \rho u$ is the momentum per unit of volume and $E = \frac{1}{2}\rho u^2 + \rho e$ is the total energy per unit of volume, sum of the kinetic energy and internal energy. This is a system of $(d + 2)$ equations and $(d + 3)$ unknowns: the density $\rho \in \mathbb{R}_+$, the speed $u \in \mathbb{R}^d$, the internal energy $e \in \mathbb{R}$ and the pressure $p \in \mathbb{R}$. In order to complete this system, we have to add a state law, for example an incomplete state law, also called *pressure law* $(\rho, e) \mapsto p(\rho, e)$.

Definition 2.1. We call *Euler compressible equations* the system made of the conservation laws (2.1) and of an incomplete state law $p = p(\rho, e)$.

A simplified model is often considered, conserving only the conservation of mass and momentum, assuming that the fluid is isentropic. This simplified system is

$$\begin{cases} \partial_t \rho + \operatorname{div}(\rho u) = 0, \\ \partial_t q + \operatorname{div}(\rho u \otimes u) + \nabla p = 0, \end{cases} \quad (2.2)$$

and the state law is a given function $\rho \mapsto p(\rho)$.

Definition 2.2. We call *isentropic Euler equations* the system (2.2) with a given state law $p = p(\rho)$ such that

$$p = - \left. \frac{\partial e}{\partial v} \right|_s,$$

where $v = 1/\rho$ is the specific volume, T is the temperature, s is the specific entropy and $f = e - Ts$ is the specific free energy, assuming we are given a complete equation of state $(v, s) \mapsto e(v, s)$.

The thermodynamical variables v, s, e, T, p must satisfy some relations described in Section 2.2. The Euler equations are a system of first order conservation law, whose study is developed in particular in the books [4, 17, 18].

2.2 State law

The state law has a strong influence on the mathematical analysis of the compressible Euler equations. The state law of “real” gases can reveal particular behaviour and introduce existence and/or uniqueness troubles which do not appear for perfect gases, see [14]. We describe below the physical principles a state law has to satisfy.

2.2.A Definitions

We consider a fluid, whose internal energy is a regular function of its specific volume¹ $v = 1/\rho$ and of its specific entropy s . This means that the gas is entitled with a *complete* state law, or energy law $e = e(v, s)$. The fundamental thermodynamic principle is then

$$de = -pdv + Tds \quad (2.3)$$

¹specific is a synonym of massic

where p is the pressure and T the temperature of the gas. Consequently, the pressure p and the temperature T can be defined as

$$p = - \left. \frac{\partial e}{\partial v} \right|_s, \quad T = \left. \frac{\partial e}{\partial s} \right|_v, \quad (2.4)$$

where the notation $|$ precises the variable maintained constant in the partial derivation.

The greater order derivatives of e have also an important role; we introduce the following adimensional quantities:

$$\gamma = - \frac{v}{p} \left. \frac{\partial p}{\partial v} \right|_s, \quad \Gamma = - \frac{v}{T} \left. \frac{\partial T}{\partial v} \right|_s, \quad \delta = \frac{pv}{T^2} \left. \frac{\partial T}{\partial s} \right|_v, \quad \mathcal{G} = - \frac{v}{2} \frac{\left. \frac{\partial^3 e}{\partial v^3} \right|_s}{\left. \frac{\partial^2 e}{\partial v^2} \right|_s}. \quad (2.5)$$

The coefficient γ is called the *adiabatic exponent*, and Γ is the *Grüneisen coefficient*. The quantities γ, δ, Γ and \mathcal{G} characterise the geometrical properties of the isentropic curves in the (v, p) plan (see [14]). They can be expressed in function of e through the relationships:

$$\gamma = \frac{v}{p} \frac{\partial^2 e}{\partial v^2}, \quad \Gamma = - \frac{v}{T} \frac{\partial^2 e}{\partial s \partial v}, \quad \delta = \frac{pv}{T^2} \frac{\partial^2 e}{\partial s^2}.$$

We also introduce the *calorific capacity at constant volume* c_v and the *calorific capacity at constant pressure* c_p by

$$c_v = \left. \frac{\partial e}{\partial T} \right|_v = \frac{T}{\left. \frac{\partial^2 e}{\partial s^2} \right|_v}, \quad c_p = T \left. \frac{\partial s}{\partial T} \right|_p. \quad (2.6)$$

These two quantities are linked with $\frac{pv}{T}$ and with γ, δ, Γ through

$$\delta c_v = \frac{pv}{T}, \quad c_p = \frac{pv}{T} \frac{\gamma}{\gamma \delta - \Gamma^2}. \quad (2.7)$$

The quantity $\gamma_* = \frac{c_p}{c_v}$ can besides be expressed as $\gamma_* = \frac{\gamma \delta}{\gamma \delta - \Gamma^2}$. It is not equal to γ in the general case, but for an ideal gas we have $\delta = \Gamma = \gamma - 1$, so that $\gamma_* = \gamma$.

2.2.B Thermodynamical constraints

It is very natural to assume $v \geq 0$. We assume furthermore that the pressure p and the temperature T are positive, which imposes that e is a function increasing in T and decreasing in v .

A classical thermodynamical hypothesis requires furthermore e to be a convex function of s and v , which means:

$$\gamma \delta - \Gamma^2 \geq 0, \quad \delta \geq 0, \quad \gamma \geq 0.$$

In particular, $\gamma \geq 0$ means that p increases with the density $\rho = 1/v$, which allows us to define the *adiabatic sound speed* by

$$c = \sqrt{\left. \frac{\partial p}{\partial \rho} \right|_s} = \sqrt{\gamma \frac{p}{\rho}}. \quad (2.8)$$

Then, we show that \mathcal{G} can be expressed in function of ρ and c through the expression $\mathcal{G} = \frac{1}{c} \frac{\partial(\rho c)}{\partial \rho} \Big|_s$.

Furthermore, we require usually $\Gamma > 0$ and $\mathcal{G} > 0$. The condition $\Gamma > 0$ is not thermodynamically required but is satisfied for many gases and ensures that the isentropes do not cross each other in the (v, p) plan. The condition $\mathcal{G} > 0$ means that the isentropes are strictly convex in the (v, p) plan.

2.2.C Van der Waals Gas

Definition 2.3. A gas is said to follow the *Van der Waals* law, if it satisfies the following pressure law:

$$p(v - b) = \Re T, \quad (2.9)$$

where v is the massic² volume and b is the *covolume*, representing the compressibility limit of the fluid, due to the volume of the molecules.

The Van der Waals law is a modification of the perfect gas law, in which $b = 0$. In opposition to the perfect gas law, it takes into account the proper size of the molecules, which is important in some situations when the gas is strongly compressed. In this model, the density must be bounded and the maximal density is $\rho_{max} = \frac{1}{b}$.

The fundamental relationship (2.3) gives us the PDE: $\partial_v e + \frac{\Re}{v-b} \partial_s e = 0$. Thus, we introduce new variables $w = (v - b)^{-\Re}$, $\sigma = (v - b)^{-\Re} \exp(s)$ and $\hat{e}(w, \sigma) = e(v, s)$. We obtain $\partial_w \hat{e} = 0$, so that $e = \mathcal{E}((v - b)^{-\Re} \exp(s))$ for any regular function \mathcal{E} .

If we assume furthermore that c_v is constant, thanks to the definition of c_v and (2.3), we get that $\frac{\partial^2 e}{\partial s^2} \Big|_v = \frac{1}{c_v} \frac{\partial e}{\partial s} \Big|_v$, hence $\sigma \mathcal{E}'' = (\frac{1}{c_v} - 1) \mathcal{E}'$ and $\mathcal{E}(\sigma) = C \sigma^{1/c_v}$ which leads to:

$$e = (v - b)^{-\frac{\Re}{c_v}} \exp\left(\frac{s}{c_v}\right), \quad p = \frac{\Re}{c_v} \frac{e}{v - b}.$$

Some computations allow us finally to obtain

$$\gamma = \gamma_0 \frac{v}{v - b}, \quad \Gamma = \delta = (\gamma_0 - 1) \frac{v}{v - b}, \quad \mathcal{G} = \frac{\gamma_0 + 1}{2} \frac{v}{v - b},$$

where

$$\gamma_0 = \frac{\Re}{c_v} + 1. \quad (2.10)$$

The conditions of Section 2.2.B are then satisfied for $\gamma_0 > 1$.

Remark 2.4. 1. A perfect gas can be seen as a Van der Waals gas with $b = 0$. A perfect gas for which c_v is constant is called *polytropic*.

2. The Van der Waals law coincides with the *dusty gas* law [8, 9, 16, 22, 24]. In this model, we consider that the gas is perfect but polluted by dust particles that are equidistributed and have a non-negligible volume.

Very often in the literature, the perfect polytropic gases are considered as a canonical example. However, their adequation with physical observations is not as good as for Van der

²also called *specific*

Waals gases, for example in explosion phenomena, or in the sonoluminescence phenomenon [1, 6, 11].

In the following, we only consider Van der Waals fluids with constant and strictly positive calorific capacity c_v :

$$c_v > 0, \quad (2.11)$$

which implies $\gamma_0 := \frac{\mathfrak{R}}{c_v} + 1 > 1$.

2.3 Symmetrisation

An important property of the Euler equation is their symmetrisability.

2.3.A General case, without vacuum

If $\rho > 0$ and $\frac{\partial p}{\partial \rho} \Big|_s > 0$ then the system (2.1) can be written in the variables (p, ρ, s) . Then, the system is almost symmetric, since it can be written matricially $\partial_t \tilde{V} + \sum_k \tilde{A}_k(\tilde{V}) \partial_k \tilde{V} = 0$, with $\tilde{V} = (p, u^{\mathbf{T}}, s)^{\mathbf{T}}$ and

$$\tilde{A}(\xi, V) = \sum_k \xi_k \tilde{A}_k(\tilde{V}) = \begin{pmatrix} u \cdot \xi & \rho c^2 \xi^{\mathbf{T}} & 0 \\ \frac{1}{\rho} \xi & u \cdot \xi I_d & 0 \\ 0 & 0 & u \cdot \xi \end{pmatrix}.$$

This matrix is almost symmetric since we obtain a symmetric matrix by multiplying it on the left by $D := \text{Diag} \left(\frac{1}{\rho c^2}, \rho, \dots, \rho, 1 \right)$. Consequently, we have the following

Proposition 2.5. *The system (2.1) is Friedrichs symmetrisable when (ρ, u, s) takes values in a compact subset of $\mathbb{R}_+^* \times \mathbb{R}^d \times \mathbb{R}$.*

Indeed, for such values of (ρ, u, s) , $D\tilde{A}(\xi, V)$ is symmetric with D symmetric definite positive.

2.3.B Van der Waals gas

We are not completely satisfied with the previous formulation as it does not authorise ρ to vanish, or even to tend to 0 at infinity. For example, ρ cannot be taken into \mathbf{H}^m for $m \geq 0$. Makino et al. have introduced in [13] a symmetrisation for perfect polytropic gases allowing the null density areas. We generalise here their method to the case of Van der Waals gases.

First, let us remind that for Van der Waals gases, we have $\gamma = \frac{\gamma_0}{1-b\rho}$ and $p = (\gamma_0 - 1) \left(\frac{\rho}{1-b\rho} \right)^{\gamma_0} \exp \left(\frac{s}{c_v} \right)$. We now introduce the new variable

$$\pi = 2 \sqrt{\frac{\gamma_0}{\gamma_0 - 1}} \left(\frac{p}{\gamma_0 - 1} \right)^{\frac{\gamma_0 - 1}{2\gamma_0}},$$

and we re-write the system (2.1) in the variables (π, u, s) . In order to do that, we first write the system (2.1) in (p, u, s) variables:

$$\begin{cases} \partial_t p + u \cdot \nabla p + \rho c^2 \operatorname{div} u = 0, \\ \partial_t u + (u \cdot \nabla) u + \frac{1}{\rho} \nabla p = 0, \\ \partial_t s + u \cdot \nabla s = 0. \end{cases} \quad (2.12)$$

Since $\pi = f(p) = Cp^\alpha$, it is sufficient to multiply the first line by $f'(p) = C\alpha p^{\alpha-1}$ to obtain an equation in π :

$$\begin{cases} \partial_t \pi + u \cdot \nabla \pi + C\alpha p^{\alpha-1} \rho c^2 \nabla \cdot u &= 0, \\ \partial_t u + (u \cdot \nabla)u + \frac{1}{\rho C\alpha p^{\alpha-1}} \exp\left(\frac{s}{\gamma_0 c_v}\right) \nabla \pi &= 0, \\ \partial_t s + u \cdot \nabla s &= 0. \end{cases}$$

Besides, we know that $c^2 = \frac{\gamma_0}{1-b\rho} \frac{p}{\rho}$, $C = 2\sqrt{\frac{\gamma_0}{\gamma_0-1}} \left(\frac{1}{\gamma_0-1}\right)^{\frac{\gamma_0-1}{2\gamma_0}}$ and $\alpha = \frac{\gamma_0-1}{2\gamma_0}$. It remains to evaluate the coefficients:

$$\begin{aligned} C\alpha p^{\alpha-1} \rho c^2 &= \frac{\gamma_0 \alpha}{1-b\rho} \pi \\ &= \frac{\gamma_0-1}{2} \frac{\pi}{1-b\rho}, \\ \frac{1}{\rho C\alpha p^{\alpha-1}} &= \frac{\exp(s/(\gamma_0 c_v))}{1-b\rho} \frac{(\gamma_0-1)^{1/\gamma_0}}{\alpha C^{(\gamma_0-1)/(\gamma_0 \alpha)}} \pi^{\frac{1-\alpha-1/\gamma_0}{\alpha}} \\ &= \exp\left(\frac{s}{\gamma_0 c_v}\right) \frac{\gamma_0-1}{2} \frac{\pi}{1-b\rho}. \end{aligned}$$

Thus,

$$\begin{cases} \partial_t \pi + u \cdot \nabla \pi + \frac{\gamma_0-1}{2} \frac{\pi}{1-b\rho} \nabla \cdot u &= 0, \\ \partial_t u + (u \cdot \nabla)u + \frac{\gamma_0-1}{2} \frac{\pi}{1-b\rho} \exp\left(\frac{s}{\gamma_0 c_v}\right) \nabla \pi &= 0, \\ \partial_t s + u \cdot \nabla s &= 0. \end{cases} \quad (2.13)$$

Moreover, $1/(1-b\rho) = 1 + b \left(\frac{\gamma_0-1}{4\gamma_0}\right)^{\frac{1}{\gamma_0-1}} \exp\left(\frac{-s}{\gamma_0 c_v}\right) \pi^{\frac{2}{\gamma_0-1}}$. Therefore, denoting

$$\nu = \frac{\gamma_0+1}{\gamma_0-1} > 1, \quad \text{and} \quad \tilde{b} = b \left(\frac{\gamma_0-1}{4\gamma_0}\right)^{\frac{1}{\gamma_0-1}}, \quad (2.14)$$

we obtain $\frac{\pi}{1-b\rho} = \pi(1 + \tilde{b}e^{-s/(\gamma_0 c_v)} \pi^{\nu-1})$, which is well defined for all $\pi \geq 0$ and in particular for $p = 0$, since we have assumed in (2.11) $\gamma_0 > 1$. The matrix associated to the system (2.13) writes now

$$A(\xi, \pi, u, s) = \begin{pmatrix} u \cdot \xi & \frac{\gamma_0-1}{2} \frac{\pi}{1-b\rho} \xi^T & 0 \\ \frac{\gamma_0-1}{2} \frac{\pi}{1-b\rho} \exp\left(\frac{s}{\gamma_0 c_v}\right) \xi & u \cdot \xi I_d & 0 \\ 0 & 0 & u \cdot \xi \end{pmatrix}.$$

It is once again “almost symmetric” in the sense that SA is symmetric, S being the diagonal definite positive matrix

$$S = \text{Diag}(1, \exp(-s/(\gamma_0 c_v)), \dots, \exp(-s/(\gamma_0 c_v)), 1).$$

Furthermore, this symmetriser is independent from p and in particular is well defined and definite positive even when p or ρ vanishes. Finally, we have the proposition:

Proposition 2.6. *For a Van der Waals gas with constant c_v and $c_v > 0$, the system of Euler equations can be written for regular solutions as (2.13) which is Friedrichs symmetrisable for $(p, u, s) \in \mathcal{K}$, where \mathcal{K} is a compact subset of $\mathbb{R}_+ \times \mathbb{R}^d \times \mathbb{R}$.*

Note that in the variables (π, u, s) , the system (2.13) can be written

$$\begin{cases} \partial_t \pi + u \cdot \nabla \pi + \frac{\gamma_0 - 1}{2} (1 + \tilde{b} \exp(\frac{-s}{\gamma_0 c_v}) \pi^{\nu-1}) \pi \nabla \cdot u &= 0, \\ \partial_t u + (u \cdot \nabla) u + \frac{\gamma_0 - 1}{2} \exp(\frac{s}{\gamma_0 c_v}) (1 + \tilde{b} \exp(\frac{-s}{\gamma_0 c_v}) \pi^{\nu-1}) \pi \nabla \pi &= 0, \\ \partial_t s + u \cdot \nabla s &= 0, \end{cases} \quad (2.15)$$

where ν and \tilde{b} are defined as in (2.14).

2.4 Local existence

The symmetrisation of Proposition 2.6 is very useful to show local existence of regular solutions with vanishing density.

Theorem 2.7. *We consider a Van der Waals gas with constant c_v such that $\gamma_0 \in]1, 3]$. Let*

$$\pi_0 = 2 \sqrt{\frac{\gamma_0}{\gamma_0 - 1}} \left(\frac{\rho_0}{1 - b \rho_0} \right)^{(\gamma_0 - 1)/2} \exp\left(\frac{\gamma_0 - 1}{2 \gamma_0 c_v} s_0\right),$$

where $\rho_0 \in \mathcal{C}^1(\mathbb{R}^3; [0, 1/b[)$. We introduce also $\nu = \frac{\gamma_0 + 1}{\gamma_0 - 1}$, $\tilde{b} = b \left(\frac{\gamma_0 - 1}{4 \gamma_0} \right)^{\frac{1}{\gamma_0 - 1}}$. We assume that $(\pi_0, u_0, s_0) \in \mathbf{H}^m(\mathbb{R}^d)$ for $m > 1 + \frac{d}{2}$. Then there exists $T > 0$ and a unique solution $(\pi, u, s) \in \mathcal{C}^1([0, T] \times \mathbb{R}^3)$ to the Cauchy problem for

$$\begin{cases} \partial_t \pi + u \cdot \nabla \pi + \frac{\gamma_0 - 1}{2} (1 + \tilde{b} \pi^{\nu-1}) \pi \nabla \cdot u &= 0, \\ \partial_t u + (u \cdot \nabla) u + \frac{\gamma_0 - 1}{2} \exp(\frac{s}{\gamma_0 c_v}) (1 + \tilde{b} \exp(\frac{-s}{\gamma_0 c_v}) \pi^{\nu-1}) \pi \nabla \pi &= 0, \\ \partial_t s + u \cdot \nabla s &= 0, \end{cases} \quad (2.16)$$

with initial condition (π_0, u_0, s_0) . Furthermore,

$$(\pi, u, s) \in \mathcal{C}([0, T]; \mathbf{H}^m(\mathbb{R}^d; \mathbb{R}^{d+2})) \cap \mathcal{C}^1([0, T]; \mathbf{H}^{m-1}(\mathbb{R}^d; \mathbb{R}^{d+2})).$$

2.5 Positivity of the density

For regular solutions, the positivity of the density is given by the following

Proposition 2.8. *Let $(\bar{\rho}, \bar{u}, \bar{s}) \in \mathcal{C}^1([0, T_{\text{ex}}[\times \mathbb{R}^d)$ be a regular solution of the Cauchy problem (2.1) associated to the regular initial conditions $(\rho_0, u_0, s_0) \in \mathcal{C}^1(\mathbb{R}^d)$. If $\nabla \bar{u} \in \mathbf{L}^\infty([0, T] \times \mathbb{R}^d)$ for all $T < T_{\text{ex}}$, $\rho_0 \in \mathbf{L}^\infty(\mathbb{R}^d, \mathbb{R})$ and if $\rho_0(x) \geq 0$ for all $x \in \mathbb{R}^d$, then for all $t \in [0, T_{\text{ex}}[$,*

$$\rho(t, x) \geq 0.$$

Proof. We use the characteristics method to obtain an expression of the solution of the Cauchy problem (1.1). Assuming $\nabla \bar{u}$ is bounded, we obtain:

$$\rho(t, x) = \rho_0(X(0; t, x)) \exp \left(- \int_0^t \operatorname{div} \bar{u}(\tau, X(\tau; t, x)) d\tau \right) > 0,$$

where X is a solution of the Cauchy problem

$$\frac{dX}{dt} = \bar{u}(t, X), \quad X(t_0; t_0, x_0) = x_0,$$

which is global in time since $\nabla \bar{u}$ is bounded. \square

We also prove that for a Van der Waals gas with constant $c_v > 0$, the variable $\pi = 2\sqrt{\frac{\gamma_0}{\gamma_0-1}} \left(\frac{p}{\gamma_0-1}\right)^{\frac{\gamma_0-1}{2\gamma_0}}$ introduced in section 2.3.B remains non-negative if it is non-negative at initial time. This property implies in particular that if $\rho_0 < 1/b$, then, as long as the regular solution exists, this property will be satisfied.

Proposition 2.9. *We consider a Van der Waals gas with constant c_v . We denote $\pi = 2\sqrt{\frac{\gamma_0}{\gamma_0-1}} \left(\frac{p}{\gamma_0-1}\right)^{\frac{\gamma_0-1}{2\gamma_0}}$, $\nu = \frac{\gamma_0+1}{\gamma_0-1}$ and $\tilde{b} = b \left(\frac{\gamma_0-1}{4\gamma_0}\right)^{\frac{1}{\gamma_0-1}}$. Let $(\bar{\pi}, \bar{u}, \bar{s}) \in \mathcal{C}^1([0, T_{\text{ex}}[\times \mathbb{R}^d)$ be a regular solution of (2.15) satisfying the initial conditions*

$$\pi(0, x) = \pi_0(x), \quad u(0, x) = u_0(x), \quad s(0, x) = s_0(x),$$

with $(\pi_0, u_0, s_0) \in \mathcal{C}^1(\mathbb{R}^d)$ and $s_0 \in \mathbf{L}^\infty$. If $\text{div } \bar{u} \in \mathbf{L}^\infty([0, T] \times \mathbb{R}^d)$ for all $T < T_{\text{ex}}$, $\pi_0 \in \mathbf{L}^\infty(\mathbb{R}^d, \mathbb{R})$ and $0 \leq \rho_0(x) < 1/b$ for all $x \in \mathbb{R}^d$, then for all $t \in [0, T_{\text{ex}}[$, $\pi \geq 0$. Then, we can define ρ , and we have:

$$0 \leq \rho(t, x) < 1/b.$$

Proof. Let $T_0 < T_{\text{ex}}$. We introduce the Cauchy problem

$$\begin{aligned} \partial_t w + \text{div}(w \bar{u}) &= g(t, x, w), \\ w(0, x) &= w_0(x), \end{aligned} \tag{2.17}$$

where

$$g(t, x, w) = \left(1 - \frac{\gamma_0 - 1}{2}(1 + \tilde{b} \exp(\frac{-\bar{s}(t, x)}{\gamma_0 c_v}) w^{\nu-1})\right) w \text{div } \bar{u}(t, x)$$

We can apply the Kruřkov theorem [10, 17]. Indeed, the hypotheses ensure that $g(t, x, w) - w \text{div}(\bar{u}(t, x)) = -\frac{\gamma_0-1}{2}(1 + \tilde{b} e^{-\bar{s}/(\gamma_0 c_v)} w^{\nu-1}) w \text{div } \bar{u}$ is uniformly bounded with respect to $x \in \mathbb{R}^d$ when w is considered as a variable taking values in a compact set. Furthermore, $\pi_0 \in \mathbf{L}^\infty$, so the regular solution $\bar{\pi}$ coincides with the entropy solution w_1 of (2.17) associated to $w_{0,1} = \pi_0$.

Besides, the entropy solution w_2 of (2.17) associated to the initial condition $w_{0,2} \equiv 0$ is the function constantly equal to 0.

After Kruřkov Theorem $w_{0,1} \geq w_{0,2}$ implies $w_1 \geq w_2$ for all $(t, x) \in [0, T_0] \times \mathbb{R}^d$, that is to say $\bar{\pi}(t, x) \geq 0$ for all $(t, x) \in [0, T_0] \times \mathbb{R}^d$. The formula:

$$\rho = \frac{1}{b} \left(1 - \frac{1}{1 + \tilde{b} \exp(\frac{-\bar{s}}{\gamma_0 c_v}) \pi^{\frac{2}{\gamma_0-1}}}\right)$$

allows us to conclude. □

3 Proof of Theorem 1.1

In order to prove this theorem, we adapt M. Grassin's idea [7]. First, we look to the isentropic case, which allows us to simplify the estimates. For a Van der Waals gas, non-linear terms now appear in the estimate which we need to treat separately.

3.1 Isentropic case

Let us consider first the isentropic case

$$\begin{cases} \partial_t \pi + u \cdot \nabla \pi + \frac{\gamma_0 - 1}{2} (1 + \tilde{b} \pi^{\nu-1}) \pi \nabla \cdot u &= 0, \\ \partial_t u + (u \cdot \nabla) u + \frac{\gamma_0 - 1}{2} (1 + \tilde{b} \pi^{\nu-1}) \pi \nabla \pi &= 0, \end{cases} \quad (3.1)$$

with initial conditions

$$\pi(0, x) = \pi_0(x), \quad u(0, x) = u_0(x). \quad (3.2)$$

which is technically simpler than the general case, but provides estimates very useful in order to treat the general case.

We consider besides the problem

$$\begin{cases} \partial_t \bar{u} + (\bar{u} \cdot \nabla) \bar{u} &= 0 & \text{on } \mathbb{R}_+ \times \mathbb{R}^d, \\ \bar{u}(0, x) &= u_0(x) & \text{on } \mathbb{R}^d, \end{cases} \quad (3.3)$$

obtained by neglecting π in (3.1). After [7, Lemme 3.1 and Prop. 3.1] we have the following preliminary result

Proposition 3.1. *Under hypotheses **(H2)** and **(H3)**, the problem (3.3) admits a global regular solution \bar{u} satisfying*

1. $D\bar{u}(t, x) = \frac{\text{Id}}{1+t} + \frac{K(t, x)}{(1+t)^2}$, for all $x \in \mathbb{R}^d$ and $t \in \mathbb{R}_+$,
2. $\|D^l \bar{u}(t, \cdot)\|_{\mathbf{L}^2} \leq K_l (1+t)^{d/2-(l+1)}$ for $l \in \llbracket 2, M+1 \rrbracket$,
3. $\|D^2 \bar{u}(t, \cdot)\|_{\mathbf{L}^\infty} \leq C(1+t)^{-3}$,

where $K : \mathbb{R}_+ \times \mathbb{R}^d \rightarrow \mathcal{M}_d(\mathbb{R})$, $\|K\|_{\mathbf{L}^\infty(\mathbb{R}_+ \times \mathbb{R}^d)} \leq K_1$, C and K_l for $l \in \llbracket 1, m+1 \rrbracket$ being non-negative constants not depending on $m, d, \delta, \|u_0\|_X$.

3.1.A Local uniqueness

Proposition 3.2. *Let $U_0 = (\pi_0, u_0)^{\mathbf{T}} \in \mathbf{H}^m(\mathbb{R}^d)$ and \tilde{U}_0 be two initial data for (3.1). Let $U = (\pi, u)^{\mathbf{T}}$, \tilde{U} be two corresponding solutions, defined for $0 \leq t \leq T_0$. We assume that $\|D\tilde{U}\|_{\mathbf{L}^\infty([0, T_0] \times \mathbb{R}^d)} < \infty$. Let $x_0 \in \mathbb{R}^d$ and $R \geq 0$. We denote*

$$M = \sup\left\{\left(\frac{\gamma_0 - 1}{2} |\pi| (1 + \tilde{b} \pi^{\nu-1}) + |u|\right)(t, x), (t, x) \in [0, T_0] \times B(x_0, R)\right\}, \quad (3.4)$$

$$C_T = \{(t, x) \in [0, T] \times B(x_0, R - Mt)\} \quad \text{for } T \in [0, T_1], \quad (3.5)$$

where $T_1 = \min(T_0, \eta/M)$. If $U_0 = \tilde{U}_0$ on $B(x_0, R)$ then $U = \tilde{U}$ on C_{T_1} .

The proof of this proposition is classical for hyperbolic systems (see for example [15]), the constant M being the maximal propagation speed.

Proof. Let $U_0 = (\pi_0, u_0)$, $\tilde{U}_0 = (\tilde{\pi}_0, \tilde{u}_0)$ be two initial data for (3.1) such that $U_0 \in \mathbf{H}^m$. Let U, \tilde{U} be the solutions of the associated Cauchy problems. We assume that these

solutions are defined on $[0, T_0]$ with $T_0 > 0$. Let also $x_0 \in \mathbb{R}^d$, $\eta \in \mathbb{R}_+^*$ and M, C_T be as in (3.4) and (3.5). Then we have:

$$\partial_t U + \sum_j a_j(U) \partial_j U = 0,$$

where

$$a_j(U) = \begin{pmatrix} u_j & 0 & \frac{\gamma_0-1}{2}(\pi + \tilde{b}\pi^\nu) & \\ 0 & \ddots & & \\ \frac{\gamma_0-1}{2}(\pi + \tilde{b}\pi^\nu) & & & 0 \\ \vdots & & \ddots & 0 \\ 0 & 0 & & u_j \end{pmatrix}.$$

Consequently, $\partial_t(U - \tilde{U}) + \sum_j a_j(U) \partial_j(U - \tilde{U}) + (a_j(U) - a_j(\tilde{U})) \partial_j \tilde{U} = 0$. Then, we make the scalar product with $(U - \tilde{U})$ and we integrate on C_T for $T \in [0, T_0]$. We get

$$\begin{aligned} & \frac{1}{2} \int_{C_T} \partial_t |U - \tilde{U}|^2 + \sum_j \partial_j \left((U - \tilde{U}) \cdot a_j(U) (U - \tilde{U}) \right) \\ & - \sum_j (U - \tilde{U}) \cdot \partial_j (a_j(U)) (U - \tilde{U}) \, dx \, dt = - \int_{C_T} (U - \tilde{U}) \cdot (a_j(U) - a_j(\tilde{U})) \partial_j \tilde{U} \, dx \, dt. \end{aligned}$$

Then using the Stokes formula and noting that $\partial C_T = (\{0\} \times B(x_0, \eta)) \cup (\{T\} \times B(x_0, \eta - MT)) \cup \mathcal{C}$, we obtain

$$\begin{aligned} & \frac{1}{2} \int_{B(x_0, R-MT)} |U - \tilde{U}|^2(T, x) \, dx - \frac{1}{2} \int_{B(x_0, \eta)} |U - \tilde{U}|^2(0, x) \, dx \\ & + \frac{1}{2\sqrt{1+1/M^2}} \int_{\mathcal{C}} |U - \tilde{U}|^2 + \sum_j (U - \tilde{U}) \cdot a_j(U) (U - \tilde{U}) \frac{x_j}{M|x|} \, d\sigma \\ & = \int_{C_T} \sum_j (U - \tilde{U}) \cdot \partial_j (a_j(U)) (U - \tilde{U}) - (U - \tilde{U}) \cdot (a_j(U) - a_j(\tilde{U})) \partial_j \tilde{U} \, dx \, dt. \end{aligned}$$

Besides $\|\partial_j a_j(u)\|_{\mathbf{L}^\infty} \leq C \|DU\|_{\mathbf{L}^\infty(C_T)} (1 + \|\pi\|_{\mathbf{L}^\infty(C_T)}^{\nu-1})$. Hence,

$$\begin{aligned} & \int_{C_T} (U - \tilde{U}) \cdot \partial_j (a_j(U)) (U - \tilde{U}) - (U - \tilde{U}) \cdot (a_j(U) - a_j(\tilde{U})) \partial_j \tilde{U} \, dx \, dt \\ & \leq C \|DU\|_{\mathbf{L}^\infty(C_T)} (1 + \|\pi\|_{\mathbf{L}^\infty(C_T)}^{\nu-1}) \int_0^T \int_{B(x_0, R-Mt)} |U - \tilde{U}|^2 \, dx \, dt. \end{aligned}$$

Furthermore, the choice of M implies

$$\int_{\mathcal{C}} |U - \tilde{U}|^2 + \sum_j (U - \tilde{U}) \cdot a_j(U) (U - \tilde{U}) \frac{x_j}{M|x|} \, d\sigma \geq 0,$$

so finally we get the estimate

$$\begin{aligned} & \frac{1}{2} \int_{B(x_0, R-MT)} |U - \tilde{U}|^2(T, x) \, dx - \frac{1}{2} \int_{B(x_0, \eta)} |U - \tilde{U}|^2(0, x) \, dx \\ & \leq C \|DU\|_{\mathbf{L}^\infty(C_T)} (1 + \|\pi\|_{\mathbf{L}^\infty(C_T)}^{\nu-1}) \int_0^T \int_{B(x_0, R-Mt)} |U - \tilde{U}|^2 \, dx \, dt. \end{aligned}$$

We conclude thanks to Gronwall lemma that

$$\frac{1}{2} \int_{B(x_0, R-MT)} |U - \tilde{U}|^2(T, x) dx \leq \frac{1}{2} e^{C'T} \int_{B(x_0, R)} |U_0 - \tilde{U}_0|^2(x) dx$$

where $C' = C\|DU\|_{\mathbf{L}^\infty(C_T)}(1 + \|\pi\|_{\mathbf{L}^\infty(C_T)}^{\nu-1})$. \square

3.1.B Local Existence

We construct a local solution of (3.1)–(3.2) such that the difference between this solution and $(0, \bar{u})$ be in $\mathcal{C}^0(\mathbb{R}_+; \mathbf{H}^m(\mathbb{R}^d; \mathbb{R}^{d+1})) \cap \mathcal{C}^1(\mathbb{R}_+; \mathbf{H}^{m-1}(\mathbb{R}^d; \mathbb{R}^{d+1}))$. The first step is the symmetrisation of the system, given by Proposition 2.6. This result allows us to use a general theorem (see Theorem 2.7) giving the local existence of solution. Let us define as above,

$$\pi = 2\sqrt{\frac{\gamma_0}{\gamma_0 - 1}} \left(\frac{p}{\gamma_0 - 1} \right)^{\frac{\gamma_0 - 1}{2\gamma_0}} = 2\sqrt{\frac{\gamma_0}{\gamma_0 - 1}} \left(\frac{\rho}{1 - b\rho} \right)^{\frac{\gamma_0 - 1}{2}}, \quad (3.6)$$

where we assume $0 \leq \rho < 1/b$. Then we use the same method as M. Grassin [7] to prove that the system (3.1) admits a local in time solution, with initial condition u_0 in the space X and not in a Sobolev space (in particular, u_0 does not tend to 0 at infinity). We use here the compactness of the support of ρ_0 (hypothesis **(H4)**) and the finite propagation speed of the solutions for an hyperbolic system. More precisely, we assume that $\text{Supp}(\rho_0) \subset B(0, R)$ for $R > 0$. Let $\eta > 0$ and $\varphi \in \mathcal{C}_c^\infty(\mathbb{R}^d; \mathbb{R}_+)$ be such that $\varphi \equiv 1$ on $B(0, R + 2\eta)$. We obtain a local in time solution (π^φ, u^φ) of the problem (3.1) with initial conditions $(\pi_0, \varphi u_0) \in \mathbf{H}^m$ for $t \in [0, T[$. The Propositions 2.8 and 2.9 ensure that the condition $0 \leq \rho < 1/b$ is satisfied.

Let $\varepsilon \in]0, T[$, we introduce the *maximal propagation speed* $M = \sup\{\frac{\gamma_0 - 1}{2}(|\pi^\varphi| + |\pi^\varphi|^\nu) + |u^\varphi|; t \in [0, T - \varepsilon], x \in \mathbb{R}^d\}$. We also introduce $\varepsilon' \in]0, \frac{\eta}{2M}[$ and $T_1 = \min(T - \varepsilon, \frac{\eta}{2M} - \varepsilon')$ the time for which this construction is available. We finally obtain a solution (π, u) of (3.1)–(3.2) by denoting

$$(\pi, u) = \begin{cases} (\pi^\varphi, u^\varphi) & \text{in } \mathcal{K}, \\ (0, \bar{u}) & \text{out of } \mathcal{K}, \end{cases}$$

where \mathcal{K} is the cone $\mathcal{K} = \{(t, x); 0 \leq t \leq T_1, x \in B(0, R + \eta + Mt)\}$. Then it is sufficient to show that the solutions can be glued smoothly along $\partial\mathcal{K}$. We use here the property of local uniqueness given below by Proposition 3.2. Let indeed $x_0 \in S(0, R + \eta)$ be the sphere of radius $R + \eta$ of centre 0 and $E_{x_0} = \{(t, x); t \in [0, T_1], x \in B(x_0, \eta - Mt)\}$. The choice of T_1 implies in particular $\partial\mathcal{K} \subset \cup_{x_0 \in S(0, R + \eta)} E_{x_0}$ (see Fig. 1). The initial conditions of (π^φ, u^φ) and $(0, \bar{u})$ coincide on E_{x_0} since the support of π_0 is included in $B(0, R)$. Proposition 3.2 allows us then to claim that $(\pi^\varphi, u^\varphi) = (0, \bar{u})$ on E_{x_0} and consequently on a neighbourhood of $\partial\mathcal{K}$.

3.1.C Energy Estimates

When we compare to the Perfect Polytopic Gas case [7], we observe that the system (3.1) has an additional term, which will modify the estimates.

Figure 1: Gluing of the solutions along $\partial\mathcal{K}$.

Let us denote $U = (\pi, u - \bar{u})$, $w = u - \bar{u}$ and $\bar{U} = (0, \bar{u})$. We also introduce

$$A_j(U) = \begin{pmatrix} u_j - \bar{u}_j & 0 & \dots & \frac{\gamma_0 - 1}{2}\pi & 0 \\ 0 & u_j - \bar{u}_j & 0 & & 0 \\ \frac{\gamma_0 - 1}{2}\pi & 0 & \ddots & & \vdots \\ & \vdots & & & 0 \\ 0 & 0 & \dots & 0 & u_j - \bar{u}_j \end{pmatrix}, \quad B(D\bar{U}, U) = \begin{pmatrix} \frac{\gamma_0 - 1}{2}\pi \operatorname{div} \bar{u} \\ (w \cdot \nabla) \bar{u} \end{pmatrix}, \quad (3.7)$$

so that the system (3.1) can be written

$$\partial_t U + \sum_{j=1}^d A_j(U) \partial_j U = -B(D\bar{U}, U) - \sum_{j=1}^d \bar{u}_j \partial_j U - F(D\bar{U}, DU, U) \quad (3.8)$$

where

$$F(D\bar{U}, DU, U) = \frac{\gamma_0 - 1}{2} \tilde{b} \pi^\nu \begin{pmatrix} \operatorname{div} (w + \bar{u}) \\ \nabla \pi \end{pmatrix}, \quad \text{with} \quad \nu = \frac{\gamma_0 + 1}{\gamma_0 - 1}. \quad (3.9)$$

Observing the properties of \bar{u} described in Proposition 3.1, we expect the terms $\|D^k U\|_{\mathbf{L}^2}$ for $k \in \llbracket 0, m \rrbracket$ to decrease with respect to time with a rate depending on k . Consequently, we introduce

$$Y_k(t) = \|D^k U(t, \cdot)\|_{\mathbf{L}^2}, \quad Z(t) = \sum_{k=0}^m (1+t)^{g_k} Y_k(t), \quad (3.10)$$

with $g_k = k + c$, in which c has to be chosen so that all the terms of Z have the same decreasing in time. In order to estimate Z , we apply the operator D^k to (3.8), we make the scalar product with $D^k U$ and we integrate on \mathbb{R}^d . The system (3.8) is different from

the one considered by M. Grassin through the term $F(D\bar{U}, DU, U)$ defined in (3.9). We use now [7, Prop. 3.2 and 3.3] to estimate the terms in common. We remind these results here:

Proposition 3.3. *Let $\alpha \in \mathbb{N}^d$ be a d -uplet of size $k \geq 0$ (that is to say $|\alpha|_1 = \alpha_1 + \dots + \alpha_d = k$). Let us denote, for $U = (\pi, u - \bar{u})$,*

$$R_k = - \int_{\mathbb{R}^d} D^k U \cdot D^k \left(\sum_{j=1}^d A_j(U) \partial_j U \right) dx ,$$

$$S_k = - \int_{\mathbb{R}^d} D^k U \cdot D^k \left(B(D\bar{U}, U) + \sum_{j=1}^d \bar{u}_j \partial_j U \right) dx ,$$

then there exists a constant $C > 0$ depending only on m, d such that

$$|R_k| \leq C(1+t)^{-g_1-d/2} Y_k^2 Z , \quad S_k \leq C(1+t)^{-g_k-2} Y_k Z - \frac{k+r}{1+t} Y_k^2 ,$$

where

$$r = \min(1 - \frac{d}{2}, (\frac{\gamma_0}{2} - 1)d) . \quad (3.11)$$

We have now to estimate $-\int_{\mathbb{R}^d} D^k U \cdot D^k (F(D\bar{U}, DU, U))$. Let us denote $\check{b} = \frac{\gamma_0-1}{2} \tilde{b}$ and

$$I = -\check{b} \int_{\mathbb{R}^d} D^k U \cdot D^k \left(\pi^\nu \left(\begin{array}{c} \operatorname{div} w \\ \nabla \pi \end{array} \right) \right), \quad J = -\check{b} \int_{\mathbb{R}^d} D^k U \cdot D^k \left(\pi^\nu \left(\begin{array}{c} \operatorname{div} \bar{u} \\ 0 \end{array} \right) \right)$$

so that $-\int_{\mathbb{R}^d} D^k U \cdot D^k (F(D\bar{U}, DU, U)) = I + J$. A priori, J is easier to estimate than I .

However the estimate of I is possible since the matrix $\pi^\nu \begin{pmatrix} 0 & \xi^T \\ \xi & 0 \end{pmatrix}$ is symmetric.

a) Estimate of I . We show in Section 4.1 the following

Lemma 3.4. *With the notations introduced in Section 3.1*

$$|I| \leq C \|\pi\|_{\mathbf{L}^\infty}^{\nu-1} \|DU\|_{\mathbf{L}^\infty} \left\| D^k U \right\|_{\mathbf{L}^2}^2 . \quad (3.12)$$

b) Estimate of J . Here, we divide J in two parts: a first part J_1 which contains only first order derivatives of \bar{u} , and a second part J_2 in which all the derivatives of \bar{u} are at least of order 2. More precisely,

$$J_1 = -\check{b} \int_{\mathbb{R}^d} \sum_{\alpha \in \mathbb{N}^d, |\alpha|_1=k} (\partial^\alpha \pi) (\partial^\alpha \pi^\nu) \operatorname{div} \bar{u} ,$$

$$J_2 = J - J_1 .$$

For J_1 , we use the first point of Proposition 3.1 giving the decreasing in time of $D\bar{u}$, and Lemma 4.7 giving the estimate:

$$\|\partial^\alpha (\pi^\nu)\|_{\mathbf{L}^2} \leq \|\pi\|_{\mathbf{L}^\infty}^{\nu-1} \left\| D^k \pi \right\|_{\mathbf{L}^2} ,$$

for all d -uplet $\alpha \in \mathbb{N}^d$ of size k , that is to say satisfying $|\alpha|_1 = \sum \alpha_i = k$.

We obtain, using the Cauchy-Schwarz inequality:

$$\begin{aligned} |J_1| &\leq \check{b} \|\partial^\alpha \pi\|_{\mathbf{L}^2} \|\partial^\alpha(\pi^\nu)\|_{\mathbf{L}^2} \|\operatorname{div} \bar{u}\|_{\mathbf{L}^\infty} \\ &\leq \frac{C}{1+t} \left\| \mathbf{D}^k U \right\|_{\mathbf{L}^2}^2 \|\pi\|_{\mathbf{L}^\infty}^{\nu-1}. \end{aligned} \quad (3.13)$$

For J_2 , we prove in Section 4.1 the following

Lemma 3.5. *With the notations introduced in Section 3.1, there exists a constant $C > 0$ such that*

$$|J_2| \leq C(1+t)^{d_k} \left\| \mathbf{D}^k U \right\|_{\mathbf{L}^2} Z^\nu, \quad (3.14)$$

where $d_k = (-g_1 - \frac{d}{2} + 1)(\nu - 1) - g_k - 2$.

c) Re-assembling of the estimates. Assembling the results of Proposition 3.3, the estimates (3.12)–(3.13)–(3.14) of I and J , and finally using Lemma 4.5, we obtain

$$\begin{aligned} \frac{1}{2} \frac{dY_k^2}{dt} + \frac{k+r}{1+t} Y_k^2 &\leq C(1+t)^\beta Y_k^2 Z + C'(1+t)^{-g_k-2} Y_k Z + C(1+t)^{\beta+(\beta+1)(\nu-1)} Y_k^2 Z^\nu \\ &\quad + C(1+t)^{(\beta+1)(\nu-1)-1} Y_k^2 Z^{\nu-1} + C(1+t)^{(\beta+1)(\nu-1)-g_k-2} Y_k Z^\nu, \end{aligned} \quad (3.15)$$

where we have denoted

$$\beta = -g_1 - \frac{d}{2}.$$

Here, we choose the constant c introduced in $g_k = k + c$ in order to have $\beta = 0$ and consequently a good decreasing in time. This means to require $g_1 + d/2 = 0$ and $c = -1 - d/2$. Consequently, we have

$$g_k = k - \frac{d}{2} - 1.$$

We introduce now

$$a = 1 + d/2 + r > 1,$$

so that $k + r = g_k + a$. We can now divide by Y_k in (3.15), multiply by $(1+t)^{g_k}$ and summate on k to obtain a differential inequality in Z (defined in (3.10)):

$$\frac{dZ}{dt} + \frac{a}{1+t} Z \leq C \left(Z^2 + \frac{Z}{(1+t)^2} + (1+t)^{\nu-1} Z^{\nu+1} \right).$$

Then, we introduce $\zeta(t) = (1+t)^a \exp\left(\frac{C}{1+t}\right) Z(t)$ and we deduce from the inequality just above

$$\frac{d\zeta}{dt} \leq \frac{C}{(1+t)^a} (\zeta^2 + \zeta^{\nu+1}).$$

Besides, $\zeta^2 + \zeta^{\nu+1} \leq 2\zeta(1 + \zeta^\nu)$ for $\nu \geq 2$. Therefore

$$\frac{1}{\zeta(1 + \zeta^\nu)} \frac{d\zeta}{dt} \leq \frac{C}{(1+t)^a},$$

that is to say

$$\frac{d}{dt}(f(\zeta(t))) \leq \frac{C}{(1+t)^a},$$

with $f(x) = \frac{1}{\nu} \ln \left(\frac{x^\nu}{1+x^\nu} \right)$. By integration, we obtain $f(\zeta(t)) + \frac{C}{a-1}(1+t)^{-(a-1)} \leq f(\zeta(0)) + \frac{C}{a-1}$. As f is strictly increasing and one-by-one from \mathbb{R}_+^* to \mathbb{R}_-^* , if $f(\zeta(0)) + C/(a-1)$ belongs to the set on which f^{-1} is well-defined, we obtain

$$\zeta(t) \leq f^{-1} \left(f(\zeta(0)) + C/(a-1) \right).$$

But $f(\zeta(0)) + C/(a-1) \leq 0$ is only possible if $\zeta(0)$ is small enough, since $f(x)$ tends to $-\infty$ when x tends to 0, and $\zeta(0) = \exp(C) Z(0) = \exp(C) \|\pi_0\|_{\mathbf{H}^m}$. The smallness condition is satisfied thanks to the hypothesis **(H1)** with $0 < \varepsilon_0 < f^{-1} \left(\frac{-C}{a-1} \right)$.

d) Conclusion. We have obtained the following inequalities

$$\begin{aligned} Z(t) &\leq \frac{1}{(1+t)^a} \exp \left(\frac{-C}{1+t} \right) f^{-1} \left(f(e^C Z(0)) + \frac{C}{a-1} \right), \\ Y_k(t) &\leq (1+t)^{-g_k} Z(t) \\ &\leq \frac{1}{(1+t)^{k+r}} \exp \left(\frac{-C}{1+t} \right) f^{-1} \left(f(e^C Z(0)) + \frac{C}{a-1} \right). \end{aligned}$$

The \mathbf{L}^2 norms of the derivatives of the local solution U consequently do not explode in finite time since $t \mapsto \frac{1}{(1+t)^a} \exp \left(\frac{-C}{1+t} \right)$ do not explode in finite time. Let us assume that the regular solution exists to time T . Our estimates give us, for all $t \in [0, T]$, for C_T not depending on T ,

$$\|(\pi, u - \bar{u})(t)\|_{\mathbf{H}^m} \leq C_T.$$

Since $\text{Supp } \pi \subset B(0, R)$, our construction is possible when the norm of (π, u) is bounded in $\mathbf{H}^m(\mathbb{R}^d)$ and

$$\|(\pi, u)(t)\|_{\mathbf{H}^m(B(0, R))} \leq C_T + \|\bar{u}(t)\|_{\mathbf{H}^m(B(0, R))} \leq K_T.$$

We can associate to the constant K_T a time of existence $T_*(K_T)$ for the local in time solution. Let $t_1 \in]0, T[$ be such that $t \geq T - T_*(K_T)$. Introducing the solution with initial condition $(\pi(t_1), u(t_1))$, we succeed in prolongating the solution up to time T , which finishes the proof.

3.2 General Case

3.2.A Local in time Existence

As in the isentropic case, we first seek to symmetrise the system. Let us denote

$$\pi = \sqrt{\frac{\gamma_0 - 1}{\gamma_0}} \left(\frac{p}{\gamma_0 - 1} \right)^{\frac{\gamma_0 - 1}{2\gamma_0}} = \sqrt{\frac{\gamma_0 - 1}{\gamma_0}} \left(\frac{\rho}{1 - b\rho} \right)^{\frac{\gamma_0 - 1}{2}} \exp \left(\frac{\gamma_0 - 1}{2\gamma_0} \frac{s}{c_v} \right).$$

The system (2.1) can be written in variables (π, u, s) :

$$\begin{cases} e^{s/(\gamma_0 c_v)} \partial_t \pi + e^{s/(\gamma_0 c_v)} u \cdot \nabla \pi + \frac{\gamma_0 - 1}{2} e^{s/(\gamma_0 c_v)} \pi \operatorname{div} u &= -\frac{\gamma_0 - 1}{2} \tilde{b} \pi^{\frac{\gamma_0 + 1}{\gamma_0 - 1}} \operatorname{div} u, \\ \partial_t u + (u \cdot \nabla) u + \frac{\gamma_0 - 1}{2} e^{s/(\gamma_0 c_v)} \pi \nabla \pi &= -\frac{\gamma_0 - 1}{2} \tilde{b} \pi^{\frac{\gamma_0 + 1}{\gamma_0 - 1}} \nabla \pi, \\ (1 + t)^{-\theta} (\partial_t s + u \cdot \nabla s) &= 0, \end{cases} \quad (3.16)$$

where $\tilde{b} = b \left(\frac{\gamma_0 - 1}{4\gamma_0} \right)^{\frac{1}{\gamma_0 - 1}}$. We introduce furthermore a parameter θ to be determined so that $(1 + t)^{-\theta} s$ has a decreasing in time similar to the estimates obtained in the isentropic case.

In order to obtain local existence of a solution, we construct a solution by following the same strategy as in the isentropic case and using once again a property of local uniqueness, given by Proposition 3.6.

3.2.B Local in time Uniqueness

We show here a similar result to the one obtained in Section 3.1.A in the isentropic case.

Proposition 3.6. *Let $U_0 = (\pi_0, u_0, s_0)^T \in \mathbf{H}^m(\mathbb{R}^d)$ and \tilde{U}_0 be two initial data for (3.1). Let $U = (\pi, u, s)^T$, \tilde{U} be the two corresponding solutions defined for $0 \leq t \leq T_0$. We assume that $\left\| D\tilde{U} \right\|_{\mathbf{L}^\infty([0, T_0] \times \mathbb{R}^d)} < \infty$. Let $x_0 \in \mathbb{R}^d$ and $R \geq 0$. We denote*

$$M = \sup \left\{ e^{\frac{s}{2\gamma_0 c_v}} \left(\frac{\gamma_0 - 1}{2} |\pi| (1 + \tilde{b} |\pi|^{\nu-1}) + |u| \right) (t, x), (t, x) \in [0, T_0] \times B(x_0, R) \right\}, \quad (3.17)$$

$$C_T = \{(t, x) \in [0, T] \times B(x_0, R - Mt)\} \quad \text{for } T \in [0, T_1], \quad (3.18)$$

where $T_1 = \min(T_0, \eta/M)$.

If $U_0 = \tilde{U}_0$ on $B(x_0, R)$ then $U = \tilde{U}$ on C_{T_1} .

Proof. Let $U_0 = (\pi_0, u_0, s_0)$, $\tilde{U}_0 = (\tilde{\pi}_0, \tilde{u}_0, \tilde{s}_0)$ be two initial data for (3.16) such that $U_0 \in \mathbf{H}^m$. Let U, \tilde{U} be the two solutions of the associated Cauchy problem. We assume that these solutions are defined on $[0, T_0]$ with $T_0 > 0$. Let furthermore $x_0 \in \mathbb{R}^d$, $\eta \in \mathbb{R}_+^*$ and M, C_T be as in (3.17) and (3.18). Then we have

$$\alpha_0(U) \partial_t U + \sum_j \alpha_j(U) \partial_j U = 0,$$

where $\alpha_0 = \operatorname{Diag}(e^{\frac{s}{\gamma_0 c_v}}, 1, \dots, 1, 1)$ and, for all $j \in \{1, \dots, d\}$,

$$\alpha_j(U) = \begin{pmatrix} e^{\frac{s}{\gamma_0 c_v}} u_j & 0 & e^{\frac{s}{\gamma_0 c_v}} \frac{\gamma_0 - 1}{2} (\pi + \tilde{b} \pi^\nu) & & \\ 0 & u_j & & & \\ e^{\frac{s}{\gamma_0 c_v}} \frac{\gamma_0 - 1}{2} (\pi + \tilde{b} \pi^\nu) & & & 0 & \\ \vdots & & & \ddots & 0 \\ 0 & 0 & & & u_j \end{pmatrix}.$$

We introduce, for $T \in [0, T_1]$,

$$I = \int_{C_T} \left(\partial_t [(U - \tilde{U}) \cdot \alpha_0(U)(U - \tilde{U})] + \sum_j \partial_j [(U - \tilde{U}) \cdot \alpha_j(U)(U - \tilde{U})] \right) dx dt. \quad (3.19)$$

Denoting $\left|U - \tilde{U}\right|_0^2 = (U - \tilde{U})\alpha_0(U)(U - \tilde{U})$ and $\left[U - \tilde{U}\right]_t = \int_{B(x_0, \eta - Mt)} \left|(U - \tilde{U})(t, x)\right|_0^2 dx$, we obtain from the Stokes formula

$$\begin{aligned} I &= \int_{\partial C_T} \left((U - \tilde{U}) \cdot \alpha_0(U)(U - \tilde{U})n_t + \sum_j (U - \tilde{U}) \cdot \alpha_j(U)(U - \tilde{U})n_j \right) d\sigma \\ &= \left[U - \tilde{U}\right]_T - \left[U - \tilde{U}\right]_0 \\ &\quad + \frac{1}{\sqrt{1 + 1/M^2}} \int_C \left(\left|U - \tilde{U}\right|_0 + \sum_j (U - \tilde{U}) \cdot \alpha_j(U)(U - \tilde{U}) \frac{x_j}{M|x|} \right) d\sigma. \end{aligned}$$

But we have also

$$\begin{aligned} &\sum_j (U - \tilde{U})\alpha_j(U)(U - \tilde{U}) \frac{x_j}{M|x|} \\ &= \left|U - \tilde{U}\right|_0^2 \frac{u \cdot x}{M|x|} + 2e^{\frac{s}{\gamma_0 c_v}} \frac{\gamma_0 - 1}{2} (\pi + \tilde{b}\pi^\nu)(\pi - \tilde{\pi}) \frac{(u - \tilde{u}) \cdot x}{M|x|} \\ &\leq \left|U - \tilde{U}\right|_0^2 \frac{|u|}{M} + e^{s/(2\gamma_0 c_v)} \frac{\gamma_0 - 1}{2} (|\pi| + \tilde{b}|\pi|^\nu)(e^{s/(\gamma_0 c_v)} |\pi - \tilde{\pi}|^2 + |u - \tilde{u}|^2) \frac{1}{M} \\ &\leq \frac{1}{M} \left|U - \tilde{U}\right|_0^2 (|u| + e^{s/(2\gamma_0 c_v)} \frac{\gamma_0 - 1}{2} (|\pi| + \tilde{b}|\pi|^\nu)) \\ &\leq \left|U - \tilde{U}\right|_0^2, \end{aligned}$$

therefore

$$I \geq \left[U - \tilde{U}\right]_T - \left[U - \tilde{U}\right]_0.$$

Besides, we have

$$\alpha_0(U)\partial_t(U - \tilde{U}) + \sum_j \alpha_j(U)(U - \tilde{U}) = \sum_j \alpha_0(U)(\alpha_0(\tilde{U})^{-1}\alpha_j(\tilde{U}) - \alpha_0(U)^{-1}\alpha_j(U))\partial_j \tilde{U},$$

thus

$$\begin{aligned} I &= \int_{C_T} (U - \tilde{U})\partial_t \alpha_0(U)(U - \tilde{U}) + \sum_j (U - \tilde{U})\partial_j \alpha_j(U)(U - \tilde{U}) \\ &\quad + 2 \int_{C_T} \sum_j \alpha_0(U)(\alpha_0(\tilde{U})^{-1}\alpha_j(\tilde{U}) - \alpha_0(U)^{-1}\alpha_j(U))\partial_j \tilde{U}. \end{aligned}$$

Let us denote

$$\begin{aligned} I_1 &= \int_{C_T} (U - \tilde{U})\partial_t \alpha_0(U)(U - \tilde{U}), \\ I_2 &= \sum_j \int_{C_T} (U - \tilde{U})\partial_j \alpha_j(U)(U - \tilde{U}), \\ I_3 &= 2 \int_{C_T} \sum_j \alpha_0(U)(\alpha_0(\tilde{U})^{-1}\alpha_j(\tilde{U}) - \alpha_0(U)^{-1}\alpha_j(U))\partial_j \tilde{U}. \end{aligned}$$

We obtain by computing explicitly $\partial_t \alpha_0$ and $\partial_j \alpha_j$

$$I_1 = - \int_{C_T} \frac{1}{\gamma_0 c_v} e^{s/(\gamma_0 c_v)} (\pi - \tilde{\pi})^2 (u \cdot \nabla s)$$

and

$$\begin{aligned} I_2 &= \int_{C_T} \frac{1}{\gamma_0 c_v} e^{s/(\gamma_0 c_v)} (\pi - \tilde{\pi})^2 (u \cdot \nabla s) + \int_{C_T} \operatorname{div}(u) \left| U - \tilde{U} \right|_0^2 \\ &\quad + \int_{C_T} (\gamma_0 - 1) e^{s/(\gamma_0 c_v)} (\pi - \tilde{\pi}) (u - \tilde{u}) \cdot \left[\frac{1}{\gamma_0 c_v} (\pi + \tilde{b} \pi^\nu) \nabla s + (1 + \tilde{b} \nu \pi^{\nu-1}) \nabla \pi \right] \\ &\leq -I_1 + \|DU\|_{\mathbf{L}^\infty} (1 + C(1 + \|\pi\|_{\mathbf{L}^\infty})(1 + \tilde{b} \nu \|\pi^{\nu-1}\|_{\mathbf{L}^\infty})) \int_0^T \left[U - \tilde{U} \right]_t dt. \end{aligned}$$

Finally, we bound I_3 by computing

$$\begin{aligned} &\alpha_0(\tilde{U})^{-1} \alpha_j(\tilde{U}) - \alpha_0(U)^{-1} \alpha_j(U) \\ &= - \left(\begin{array}{c|c|c} u_j - \tilde{u}_j & \frac{\gamma_0 - 1}{2} (\pi - \tilde{\pi} + \tilde{b}(\pi^\nu - \tilde{\pi}^\nu)) \mathbf{e}_j \mathbf{T} & 0 \\ \hline \Psi \mathbf{e}_j & (u_j - \tilde{u}_j) I_d & 0 \\ \hline 0 & 0 & u_j - \tilde{u}_j \end{array} \right), \end{aligned}$$

where $\Psi = \frac{\gamma_0 - 1}{2} (e^{\frac{s}{\gamma_0 c_v}} (\pi + \tilde{b} \pi^\nu) - e^{\frac{\tilde{s}}{\gamma_0 c_v}} (\tilde{\pi} + \tilde{b} \tilde{\pi}^\nu))$. We denote $R = \max(\|\pi\|_{\mathbf{L}^\infty}, \|\tilde{\pi}\|_{\mathbf{L}^\infty})$. The exponential function being convex, we have:

$$\left| e^{s/(\gamma_0 c_v)} - e^{\tilde{s}/(\gamma_0 c_v)} \right| \leq 1/(\gamma_0 c_v) e^{R/(\gamma_0 c_v)} |s - \tilde{s}|.$$

So,

$$e^{s/(\gamma_0 c_v)} (\pi + \tilde{b} \pi^\nu) - e^{\tilde{s}/(\gamma_0 c_v)} (\tilde{\pi} + \tilde{b} \tilde{\pi}^\nu) \leq C(1 + R^{\nu-1})(|\pi|s - \tilde{s}| + |\pi - \tilde{\pi}|),$$

which gives us

$$\begin{aligned} I_3 &\leq \left(\left\| D\tilde{U} \right\|_{\mathbf{L}^\infty} (1 + C(1 + \|\pi\|_{\mathbf{L}^\infty})(1 + \tilde{b} \nu \|\pi^{\nu-1}\|_{\mathbf{L}^\infty})) \right. \\ &\quad \left. + \|DU\|_{\mathbf{L}^\infty} (1 + C(1 + \|\pi\|_{\mathbf{L}^\infty})(1 + \tilde{b} \nu \|\pi^{\nu-1}\|_{\mathbf{L}^\infty})) \right) \int_0^T \left[U - \tilde{U} \right]_t dt. \end{aligned}$$

Finally, we obtain

$$\left[U - \tilde{U} \right]_T - \left[U - \tilde{U} \right]_0 \leq C(1 + C(1 + \|\pi\|_{\mathbf{L}^\infty})(1 + \tilde{b} \nu \|\pi^{\nu-1}\|_{\mathbf{L}^\infty})) \int_0^T \left[U - \tilde{U} \right]_t dt.$$

We conclude thanks to Gronwall Lemma

$$\frac{1}{2} \int_{B(x_0, R-MT)} \left| U - \tilde{U} \right|^2(T, x) dx \leq \frac{1}{2} e^{C'T} \int_{B(x_0, R)} \left| U_0 - \tilde{U}_0 \right|^2(x) dx$$

where $C' = C\|DU\|_{\mathbf{L}^\infty(C_T)}(1 + \|\pi\|_{\mathbf{L}^\infty(C_T)}^{\nu-1})$. □

3.2.C Estimates

The system (3.16) can be written

$$A_0 \partial_t V + \sum_{j=1}^d A_j \partial_j = -B(D\bar{V}, V) - \sum C_j(\bar{V}) \partial_j V - \frac{\gamma_0 - 1}{2} \tilde{b} \pi^\nu \begin{pmatrix} \operatorname{div}(w + \bar{u}) \\ \nabla \pi \\ 0 \end{pmatrix}, \quad (3.20)$$

where $V = (\pi, u - \bar{u}, s) \in \mathbb{R}^{d+2}$, $\bar{V} = (0, \bar{u}, 0)$ and, denoting $(\mathbf{e}_j)_{1 \leq j \leq d}$ the standard orthonormal basis of \mathbb{R}^d ,

$$\begin{aligned} A_0 &= \operatorname{Diag}(e^{s/(\gamma_0 c_v)}, 1, \dots, 1, (1+t)^{-\theta}) \in \mathcal{M}_{d+2}(\mathbb{R}), \\ C_j &= \bar{u}_j A_0, \\ A_j &= \begin{pmatrix} e^{s/(\gamma_0 c_v)} w_j & \frac{\gamma_0 - 1}{2} e^{s/(\gamma_0 c_v)} \pi \mathbf{e}_j^T & 0 \\ \frac{\gamma_0 - 1}{2} e^{s/(\gamma_0 c_v)} \pi \mathbf{e}_j & w_j I_d & 0 \\ 0 & 0 & (1+t)^{-\theta} w_j \end{pmatrix}, \\ B &= \begin{pmatrix} \frac{\gamma_0 - 1}{2} e^{s/(\gamma_0 c_v)} \pi \operatorname{div} \bar{u} \\ (w \cdot \nabla) \bar{u} \\ 0 \end{pmatrix}. \end{aligned}$$

We also introduce $N_k(t) = \left(\int_{\mathbb{R}^d} D^k V \cdot A_0(V) D^k V \, dx \right)^{1/2}$ and $Z(t) = \sum_{k=0}^m (1+t)^{g_k} N_k(t)$ with $g_k = k + r - a$ and $r = \theta/2 - d/2$, $\theta \in]0, \min(1, \frac{\gamma_0 - 1}{2})]$. In order to obtain energy estimates, we apply D^k to (3.20) and we multiply it by $D^k V$. Then, we integrate on \mathbb{R}^d . The additional term with respect to the Perfect Polytopic gases considered by M. Grassin [7] is now

$$F^*(D\bar{V}, DV, V) = \frac{\gamma_0 - 1}{2} \tilde{b} \pi^\nu (\operatorname{div}(w + \bar{u}), \nabla \pi, 0) \in \mathbb{R}^{d+2}.$$

With the notations $U = (\pi, w) \in \mathbb{R}^{d+1}$ and F as in (3.9), the last component of F^* being 0, we have

$$\int_{\mathbb{R}^d} \partial^k V \partial^k (F^*(D\bar{V}, DV, V)) \, dx = \int_{\mathbb{R}^d} \partial^k U \partial^k (F(D\bar{U}, DU, U)) \, dx.$$

Using the estimates (3.12)–(3.13)–(3.14) we finally get an estimate on Y_k . The definition of the norm is slightly changed with respect to isentropical case, however, for all $v = (v_1, \dots, v_{d+1}) \in \mathbb{R}^{d+1}$, if $v^* = (v_1, \dots, v_{d+1}, z) \in \mathbb{R}^{d+2}$, we have $\|v\|_2 \leq e^{\|s_0\|_{L^\infty}/(\gamma_0 c_v)} t_{v^*} A_0 v^*$. Consequently $Y_k \leq e^{\|s_0\|_{L^\infty}/(\gamma_0 c_v)} N_k$ and the estimates on Y_k obtained in the isentropical case give an estimate on N_k in the general case.

Finally, we obtain, adding the estimate on F obtained in the isentropical case to the

estimates from M. Grassin in the general case:

$$\begin{aligned} \frac{1}{2} \frac{dN_k^2}{dt} + \frac{k+r}{1+t} N_k^2 &\leq C(1+t)^\beta N_k^2 Z + C'(1+t)^{-g_k-2} N_k Z + C(1+t)^{\beta+(\beta+1)(\nu-1)} N_k^2 Z^\nu \\ &\quad + C(1+t)^{(\beta+1)(\nu-1)-1} N_k^2 Z^{\nu-1} + C(1+t)^{(\beta+1)(\nu-1)-g_k-2} N_k Z^\nu \\ &\quad + C \sum_{\xi \in E_k} N_k Z^{2+\xi} (1+t)^{-g_k+\beta+\xi(\beta+1+\theta/2)} \end{aligned}$$

where $\beta = -g_1 - \frac{d}{2}$ and

$$E_k = \llbracket 0, k \rrbracket \cup \left\{ \frac{l}{k-1}; l \in \llbracket 1, k-1 \rrbracket \right\}.$$

Then, we choose a so that $\beta = 0$, i.e.

$$a = 1 + \theta/2 > 1 \text{ with } \theta \in]0, \min(1, \frac{\gamma_0 - 1}{2})].$$

Next, we simplify by N_k , we multiply by $(1+t)^{g_k}$ and we summate on k to obtain

$$\frac{dZ}{dt} + \frac{a}{1+t} Z \leq C \left(Z^2 + \frac{Z}{(1+t)^2} + (1+t)^{\nu-1} Z^{\nu+1} + Z^{2+m} (1+t)^{am} \right).$$

We denote now $\zeta(t) = (1+t)^a \exp\left(\frac{C}{1+t}\right) Z(t)$ and we deduce from the inequality just above

$$\frac{d\zeta}{dt} \leq \frac{C}{(1+t)^a} (\zeta^2 + \zeta^{\nu+1} + \zeta^{m+2}).$$

We conclude in the same way we did in the isentropic case, replacing ν by $\nu^* = \max(\nu, m+1) \geq 2$, since $\zeta^2 + \zeta^{\nu+1} + \zeta^{m+2} \leq 2(\zeta^2 + \zeta^{\nu^*+1})$.

4 Technical tools

4.1 Lemmas 3.4 and 3.5

We show here Lemma 3.4, which states, with the notations introduced in Section 3.1:

$$|I| \leq C \|\pi\|_{\mathbf{L}^\infty}^{\nu-1} \|DU\|_{\mathbf{L}^\infty} \left\| D^k U \right\|_{\mathbf{L}^2}^2.$$

Proof of Lemma 3.4.

If $k = 0$, $I = -\check{b} \int_{\mathbb{R}^d} \pi^\nu (\pi \operatorname{div} w + w \cdot \nabla w) dx$. By integration by parts, we obtain

$$I = -\check{b} \frac{\nu}{\nu+1} \int_{\mathbb{R}^d} \pi^{\nu+1} \operatorname{div} w dx \leq C \left\| \pi^{\nu-1} \right\|_{\mathbf{L}^\infty} \|\pi\|_{\mathbf{L}^2}^2 \|\operatorname{div} w\|_{\mathbf{L}^\infty}.$$

If $k \geq 1$, I is such that

$$I = -\check{b} \sum_{\alpha \in \mathbb{N}^d, |\alpha|_1 = k} \int_{\mathbb{R}^d} \partial^\alpha \pi \partial^\alpha (\pi^\nu \operatorname{div} w) + \sum_j \partial^\alpha w_j \partial^\alpha (\pi^\nu \partial_j \pi).$$

Expanding, we find

$$I = -\check{b} \sum_{\alpha \in \mathbb{N}^d, |\alpha|_1 = k} \int_{\mathbb{R}^d} \partial^\alpha(\pi) \pi^\nu \partial^\alpha(\operatorname{div} w) + \sum_j \partial^\alpha(w_j) \pi^\nu \partial^\alpha(\partial_j \pi) + \Sigma,$$

where Σ is a sum of terms as $\int_{\mathbb{R}^d} \partial^{\alpha_0} U \partial^{\alpha_1}(\pi^\nu) \partial^{\alpha_2} U$, where U is any of its component and $|\alpha_0|_1 = k$, $|\alpha_1|_1 = l$, $|\alpha_2|_1 = k+1-l$, with $l \in \llbracket 1, k \rrbracket$ so that the derivatives are of order less than k . We treat first one of the terms of the preceding sum for a d -uplet $\alpha \in \mathbb{N}^d$, of size k , that is to say $|\alpha|_1 = \alpha_1 + \dots + \alpha_d = k$. By integration by parts, we find

$$\begin{aligned} & \int_{\mathbb{R}^d} \partial^\alpha(\pi) \pi^\nu \partial^\alpha(\operatorname{div} w) + \sum_j \partial^\alpha(w_j) \pi^\nu \partial^\alpha(\partial_j \pi) \\ &= \int_{\mathbb{R}^d} \pi^\nu \sum_j \partial_j (\partial^\alpha(\pi) \partial^\alpha(w_j)) \\ &= - \sum_j \int_{\mathbb{R}^d} \partial_j(\pi^\nu) \partial^\alpha(\pi) \partial^\alpha(w_j), \end{aligned}$$

Hence, I is a sum of terms as $\int \partial^k U \partial^l(\pi^\nu) \partial^{k-l+1} U$ where $1 \leq l \leq k-1$.

Note that we used here the notation after which $\partial^k U$ means $\partial^\alpha U$ for a given $\alpha \in \mathbb{N}^d$ such that $|\alpha|_1 = \sum \alpha_j = k$. Furthermore, we write U for any of its component. Consequently, $\partial^k U$ can mean $\partial^\alpha w_j$. We will use by now this notation.

If $k \geq 1$ and $l \neq 1$, $l \neq k$, using the Hölder inequality and the Gagliardo-Nirenberg Lemma 4.1, we have:

$$\begin{aligned} \int_{\mathbb{R}^d} \partial^k U \partial^l(\pi^\nu) \partial^{k-l+1} U \, dx &\leq \left\| \partial^k U \right\|_{\mathbf{L}^2} \left\| \partial^l(\pi^\nu) \partial^{k-l+1} U \right\|_{\mathbf{L}^2} \\ &\leq \left\| \partial^k U \right\|_{\mathbf{L}^2} \left\| \partial^l(\pi^\nu) \right\|_{\mathbf{L}^2 \frac{k-1}{l-1}} \left\| \partial^{k-l+1} U \right\|_{\mathbf{L}^2 \frac{k-1}{k-l}} \\ &\leq \left\| \partial^k U \right\|_{\mathbf{L}^2} \left\| \partial(\pi^\nu) \right\|_{\mathbf{L}^\infty}^{\frac{1-l}{k-1}} \left\| \partial^k(\pi^\nu) \right\|_{\mathbf{L}^2}^{\frac{l-1}{k-1}} \\ &\quad \times \left\| \partial U \right\|_{\mathbf{L}^\infty}^{1-\frac{k-l}{k-1}} \left\| \partial^k U \right\|_{\mathbf{L}^2}^{\frac{k-l}{k-1}}. \end{aligned}$$

We use next Lemma 4.7 and the inequality

$$\left\| \partial(\pi^\nu) \right\|_{\mathbf{L}^\infty} = \left\| \nu \pi^{\nu-1} \partial \pi \right\|_{\mathbf{L}^\infty} \leq C \left\| \pi \right\|_{\mathbf{L}^\infty}^{\nu-1} \left\| \partial \pi \right\|_{\mathbf{L}^\infty},$$

to obtain

$$\int_{\mathbb{R}^d} \partial^k U \partial^l(\pi^\nu) \partial^{k-l+1} U \, dx \leq C \left\| \partial^k U \right\|_{\mathbf{L}^2}^2 \left\| \partial U \right\|_{\mathbf{L}^\infty} \left\| \pi \right\|_{\mathbf{L}^\infty}^{\nu-1}.$$

If $k \geq 1$ and $l = k$, we have to estimate

$$\begin{aligned} \int_{\mathbb{R}^d} \partial^k U \partial^k(\pi^\nu) \partial U &\leq \left\| \partial^k U \right\|_{\mathbf{L}^2} \left\| \partial^k(\pi^\nu) \right\|_{\mathbf{L}^2} \left\| \partial U \right\|_{\mathbf{L}^\infty} \\ &\leq \left\| \partial^k U \right\|_{\mathbf{L}^2} \left\| \pi \right\|_{\mathbf{L}^\infty}^{\nu-1} \left\| \partial^k \pi \right\|_{\mathbf{L}^2} \left\| \partial U \right\|_{\mathbf{L}^\infty}. \end{aligned}$$

If $k \geq 1$ and $l = 1$, we have to estimate

$$\begin{aligned} \int_{\mathbb{R}^d} \partial^k U \partial(\pi^\nu) \partial^k U &\leq \left\| \partial^k U \right\|_{\mathbf{L}^2} \left\| \partial^k(\pi^\nu) \right\|_{\mathbf{L}^2} \left\| \partial U \right\|_{\mathbf{L}^\infty} \\ &\leq \left\| \partial^k U \right\|_{\mathbf{L}^2}^2 \left\| \partial^1(\pi^\nu) \right\|_{\mathbf{L}^\infty}. \end{aligned}$$

The inequality $\left\| \partial^1(\pi^\nu) \right\|_{\mathbf{L}^\infty} \leq C \left\| \pi \right\|_{\mathbf{L}^\infty}^{\nu-1} \left\| \partial^1 \pi \right\|_{\mathbf{L}^\infty}$ allows us to conclude.

□

We prove now Lemma 3.5, which states, with the notations introduced in Section 3.1

$$J_2 \leq C(1+t)^{d_k} \left\| \mathbf{D}^k U \right\|_{\mathbf{L}^2} Z^\nu,$$

where $d_k = (\beta + 1)(\nu - 1) - g_k - 2$ and $\beta = -g_1 - \frac{d}{2}$.

Proof of Lemma 3.5. For $k = 0$, $J_2 = 0$. We are considering here $k \geq 1$; J_2 is then a sum of terms $\int \partial^k U \partial^l(\pi^\nu) \partial^{k-l+1} \bar{u} dx$ for $0 \leq l \leq k-1$. The choice of initial conditions gives us $U \in \mathbf{H}^m$, but we do not know if $\mathbf{D}^2 U \in \mathbf{L}^\infty$. So we can distinguish two cases: $m > 2 + d/2$ and $\mathbf{D}^2 U \in \mathbf{L}^\infty$, or $m \leq 2 + d/2$.

Case $m > 2 + d/2$. We study now different cases, after the values of k and l .

1. If $k \geq 1$ and $l = 0$, we use Proposition 3.1 and Lemma 4.7 to obtain the estimate

$$\begin{aligned} \int_{\mathbb{R}^d} \pi^\nu \partial^k \pi \partial^{k+1} \bar{u} dx &\leq \left\| \pi^\nu \right\|_{\mathbf{L}^\infty} \left\| \partial^k U \right\|_{\mathbf{L}^2} \left\| \partial^{k+1} \bar{u} \right\|_{\mathbf{L}^2} \\ &\leq C(1+t)^{(\beta+1)\nu} Z^\nu \left\| \mathbf{D}^k U \right\|_{\mathbf{L}^2} (1+t)^{d/2-k-2} \\ &\leq C(1+t)^{d_k} \left\| \mathbf{D}^k U \right\|_{\mathbf{L}^2} Z^\nu, \end{aligned}$$

since $k - d/2 + 2 = \beta + 1 + g_k + 2$ we are done.

2. If $k \geq 2$ and $l = 1$, we have to estimate

$$\begin{aligned} \int_{\mathbb{R}^d} \pi^{\nu-1} \partial \pi \partial^k \pi \partial^k \bar{u} dx &\leq \left\| \partial^k \pi \right\|_{\mathbf{L}^2} \left\| \partial^k \bar{u} \right\|_{\mathbf{L}^2} \left\| \pi \right\|_{\mathbf{L}^\infty}^{\nu-1} \left\| \partial \pi \right\|_{\mathbf{L}^\infty} \\ &\leq C(1+t)^{d/2-k-1} (1+t)^{(\beta+1)(\nu-1)+\beta} Z^\nu \left\| \partial^k U \right\|_{\mathbf{L}^2}, \end{aligned}$$

which concludes that case, since $d/2 - k - 1 + \beta + (\beta+1)(\nu-1) = (\beta+1)(\nu-1) - g_k - 2$.

3. If $k = 3$ and $l = 2$,

$$\begin{aligned} \int_{\mathbb{R}^d} \partial^3 \pi \partial^2(\pi^\nu) \partial^2 \bar{u} dx &\leq \left\| \partial^3 \pi \right\|_{\mathbf{L}^2} \left\| \partial^2 \bar{u} \right\|_{\mathbf{L}^\infty} \left\| \partial^2(\pi^\nu) \right\|_{\mathbf{L}^2} \\ &\leq (1+t)^{-3+(\beta+1)(\nu-1)-g_2} \left\| \partial^3 U \right\|_{\mathbf{L}^2} Z^\nu, \end{aligned}$$

and we are done as $g_2 + 3 = g_3 + 2$.

4. If $k > 3$ and $l \in \llbracket 2, k-1 \rrbracket$, we use Lemma 4.2. Denoting $q = 2\frac{k-3}{l-2}$ and $q' = 2\frac{k-3}{k-l-1}$ so that $1/q + 1/q' = 1/2$, we obtain:

$$\begin{aligned} & \int_{\mathbb{R}^d} \partial^k \pi \partial^l (\pi^\nu) \partial^{k-l+1} \bar{u} \, dx \\ & \leq \left\| \partial^k U \right\|_{\mathbf{L}^2} \left\| \partial^l (\pi^\nu) \right\|_{\mathbf{L}^q} \left\| \partial^{k-l+1} \bar{u} \right\|_{\mathbf{L}^{q'}} \\ & \leq \left\| \partial^k U \right\|_{\mathbf{L}^2} \left\| D^2 (\pi^\nu) \right\|_{\mathbf{L}^\infty}^{1-2/q} \left\| D^{k-1} (\pi^\nu) \right\|_{\mathbf{L}^2}^{2/q} \left\| D^2 \bar{u} \right\|_{\mathbf{L}^\infty}^{1-2/q'} \left\| D^{k-1} \bar{u} \right\|_{\mathbf{L}^2}^{2/q'}. \end{aligned}$$

Since

$$\left\| D^2 \bar{u} \right\|_{\mathbf{L}^\infty} \leq C(1+t)^{-3}, \quad \left\| D^{k-1} \bar{u} \right\|_{\mathbf{L}^2} \leq C(1+t)^{d/2-k},$$

and

$$\begin{aligned} \left\| D^2 (\pi^\nu) \right\|_{\mathbf{L}^\infty} & \leq C \left(\|\pi\|_{\mathbf{L}^\infty}^{\nu-2} \|D\pi\|_{\mathbf{L}^\infty}^2 + \|\pi\|_{\mathbf{L}^\infty}^{\nu-1} \left\| D^2 \pi \right\|_{\mathbf{L}^\infty} \right) \\ & \leq C(1+t)^{(\beta+1)\nu-2} Z^\nu, \\ \left\| D^{k-1} (\pi^\nu) \right\|_{\mathbf{L}^2} & \leq C \|\pi\|_{\mathbf{L}^\infty}^{\nu-1} \left\| D^{k-1} \pi \right\|_{\mathbf{L}^2} \\ & \leq C(1+t)^{(\beta+1)(\nu-1)-g_k+1} Z^\nu. \end{aligned}$$

we obtain

$$J_2 \leq C(1+t)^{m_k} \left\| D^k \pi \right\|_{\mathbf{L}^2} Z^\nu,$$

where

$$\begin{aligned} m_k & = -3 \left(1 - \frac{2}{q} \right) - \frac{2}{q} (1 + \beta + g_k) + \frac{2}{q} ((\beta+1)\nu - 2) \\ & \quad + \left(1 - \frac{2}{q} \right) ((\beta+1)(\nu-1) - g_k + 1) \\ & = (\beta+1)(\nu-1) - g_k - 2 \\ & = d_k. \end{aligned}$$

Case $m \leq 2 + d/2$.

First, we note that the computations of the case $k \geq 1$ and $l = 0$, $k \geq 2$ and $l = 1$, $k = 3$ and $l = 2$ are similar. There remains to treat the case $k > 3$ and $2 \leq l \leq k-1$. Since $k \leq m \leq 2 + d/2$ we have necessarily $k \leq 3$, if $d = 1, 2$ or 3 , and we are done.

We assume now $d \geq 4$. Let us denote $h = \frac{1}{2}(k+1+d/2) > 2$. Then we have $h \leq m$ and

$$0 < h - l \leq \frac{d-1}{2}, \quad \frac{1}{2} \leq h - (k+1-l) \leq \frac{d-1}{2}.$$

We introduce $h_1 = h - l$, $h_2 = h - (k - l + 1)$ and $1/q_1 = 1/2 - h_1/d$, $1/q_2 = 1/2 - h_2/d$. Therefore $1/q_1 + 1/q_2 = 2$, which allows to use Hölder inequality

$$J_2(k, l) = \int_{\mathbb{R}^d} \partial^k \pi \partial^l (\pi^\nu) \partial^{k-l+1} \bar{u} \, dx \leq \left\| \partial^k \pi \right\|_{\mathbf{L}^2} \left\| \partial^l (\pi^\nu) \right\|_{\mathbf{L}^{q_1}} \left\| \partial^{k-l+1} \bar{u} \right\|_{\mathbf{L}^{q_2}}.$$

Next, we apply Lemma 4.3 to find

$$J_2(k, l) \leq C \left\| \partial^k \pi \right\|_{\mathbf{L}^2} \left\| D^n(\pi^\nu) \right\|_{\mathbf{L}^2} \left\| D^h \bar{u} \right\|_{\mathbf{L}^2}.$$

Finally, we use Lemma 4.7 and Proposition 3.1

$$J_2(k, l) \leq C \left\| \partial^k U \right\|_{\mathbf{L}^2} (1+t)^{d/2-h-1-g_h+(\beta+1)(\nu-1)} Z^\nu.$$

As $d/2 - h - 1 - g_h + (\beta + 1)(\nu - 1) = (\beta + 1)(\nu - 1) - g_k - 2$, we are done. \square

4.2 The Gagliardo-Nirenberg inequality and its consequences

4.2.A The Gagliardo-Nirenberg inequality

Lemma 4.1 (Gagliardo-Nirenberg). *(See [23, Prop. 3.5, p. 4]) Let $r > 0$, $i \in [0, r]$ and $z \in (\mathbf{L}^\infty \cap \mathbf{H}^r)(\mathbb{R}^d)$. Then $\partial^i z \in \mathbf{L}^{2r/i}(\mathbb{R}^d)$ and*

$$\left\| \partial^i z \right\|_{\mathbf{L}^{2r/i}} \leq C_{i,r} \|z\|_{\mathbf{L}^\infty}^{1-i/r} \|D^r z\|_{\mathbf{L}^2}^{i/r}.$$

We deduce easily from Lemma 4.1 the following result.

Lemma 4.2. *Let $z \in \mathbf{H}^m$ be such that $D^2 z \in \mathbf{L}^\infty$, then for all $k \in [4, m]$, for all $i \in [2, k]$, we have $D^i z \in \mathbf{L}^q$ for $q = 2\frac{k-3}{i-2}$ and*

$$\left\| \partial^i z \right\|_{\mathbf{L}^q} \leq C \left\| D^2 z \right\|_{\mathbf{L}^\infty}^{1-2/q} \left\| D^{k-1} z \right\|_{\mathbf{L}^2}^{2/q}.$$

Thanks to the Sobolev imbedding (see [23, p.4]) and Lemma 4.1 we also prove

Lemma 4.3. *Let $\ell \in]0, d/2[$ and $1/q = 1/2 - \ell/d$. There exists $C > 0$ depending on ℓ, q, d such that for all $z \in \mathbf{H}^\ell(\mathbb{R}^d)$ we have*

$$\|z\|_{\mathbf{L}^q} \leq C \left\| D^\ell z \right\|_{\mathbf{L}^2}.$$

Proof. The space $\mathbf{H}^\ell(\mathbb{R}^d)$ is endowed with the norm $\|\cdot\|_{\mathbf{L}^2} + \|D^\ell \cdot\|_{\mathbf{L}^2}$. The Sobolev imbedding between \mathbf{H}^ℓ and \mathbf{L}^q can be written, for a given $C > 0$,

$$\|z\|_{\mathbf{L}^q} \leq C(\|z\|_{\mathbf{L}^2} + \|D^\ell z\|_{\mathbf{L}^2}), \quad \text{for all } z \in \mathbf{H}^\ell. \quad (4.1)$$

Let us define now, for $z \in \mathbf{H}^\ell$, $\lambda \in \mathbb{R}_+$, the function $z_\lambda \in \mathbf{H}^\ell$ such that $z_\lambda(x) = z(\lambda x)$. Applying (4.1) to z_λ , and noting that

$$\|z_\lambda\|_{\mathbf{L}^q} = \lambda^{-\frac{d}{q}} \|z\|_{\mathbf{L}^q}, \quad \left\| D^\ell z_\lambda \right\|_{\mathbf{L}^2} = \lambda^{\ell-\frac{d}{2}} \left\| D^\ell z \right\|_{\mathbf{L}^2}, \quad (4.2)$$

we obtain

$$\|z\|_{\mathbf{L}^q} \leq C \lambda^{\frac{d}{q}-\frac{d}{2}} (\|z\|_{\mathbf{L}^2} + \lambda^\ell \|D^\ell z\|_{\mathbf{L}^2}),$$

where, by definition $\frac{d}{q} - \frac{d}{2} = -\ell$. Consequently, introducing $\lambda = \left(\frac{\|z\|_{\mathbf{L}^2}}{\|D^\ell z\|_{\mathbf{L}^2}} \right)^{1/\ell}$, we have

$$\|z\|_{\mathbf{L}^q} \leq 2C \left\| D^\ell z \right\|_{\mathbf{L}^2}.$$

\square

Similarly,

Lemma 4.4. *Let $p > d/2$. There exists $C > 0$ such that for all $z \in \mathbf{H}^p(\mathbb{R}^d)$*

$$\|z\|_{\mathbf{L}^\infty} \leq C \|z\|_{\mathbf{L}^2}^{1-\frac{d}{2p}} \|D^p z\|_{\mathbf{L}^2}^{\frac{d}{2p}}.$$

Proof. We use now the continuous imbedding $\mathbf{H}^p(\mathbb{R}^d) \subset \mathbf{L}^\infty(\mathbb{R}^d)$. Thus, there exists $C > 0$ such that

$$\|z\|_{\mathbf{L}^\infty} \leq C(\|z\|_{\mathbf{L}^2} + \|D^p z\|_{\mathbf{L}^2}), \quad \text{for all } z \in \mathbf{H}^p.$$

Applying the inequality to $z_\lambda : x \mapsto z(\lambda x)$, we obtain, since z_λ satisfies $\|z_\lambda\|_{\mathbf{L}^\infty} = \|z\|_{\mathbf{L}^\infty}$ and (4.2),

$$\|z\|_{\mathbf{L}^\infty} \leq C \lambda^{\frac{-d}{2}} (\|z\|_{\mathbf{L}^2} + \lambda^p \|D^p z\|_{\mathbf{L}^2}).$$

Taking $\lambda = \left(\frac{\|z\|_{\mathbf{L}^2}}{\|D^p z\|_{\mathbf{L}^2}} \right)^{1/p}$, we have finished the proof. \square

4.2.B Estimates

Lemma 4.5. *Let $m > 1 + d/2$, $U \in \mathbf{H}^m(\mathbb{R}^d)$, $r, a \in \mathbb{R}$ and Z be the norm defined by (3.10) :*

$$Z(t) = \sum_{k=0}^m (1+t)^{g_k} \|D^k U(t)\|_{\mathbf{L}^2},$$

with $g_k = k + r - a$. Then we have:

1. $\|U(t)\|_{\mathbf{L}^\infty} \leq C(1+t)^{\beta+1} Z(t),$
2. $\|DU(t)\|_{\mathbf{L}^\infty} \leq C(1+t)^\beta Z(t),$
3. If $m > 2 + d/2$, then $\|D^2 U(t)\|_{\mathbf{L}^\infty} \leq C(1+t)^{\beta-1} Z(t),$

with $\beta = -g_1 - d/2$.

Proof. 1. Applying Lemma 4.4 to U , we obtain:

$$\|U\|_{\mathbf{L}^\infty} \leq C \|U\|_{\mathbf{L}^2}^{1-\frac{d}{2m}} \|D^m U\|_{\mathbf{L}^2}^{\frac{d}{2m}}.$$

But we also have

$$\|U\|_{\mathbf{L}^2} \leq (1+t)^{-g_0} Z, \quad \|D^m U\|_{\mathbf{L}^2} \leq (1+t)^{-g_m} Z,$$

so

$$\|U\|_{\mathbf{L}^\infty} \leq C(1+t)^s Z,$$

where $s = -g_0(1 - \frac{d}{2m}) - (g_0 + m)\frac{d}{2m} = -g_0 - \frac{d}{2} = \beta + 1$.

2. Applying Lemma 4.4 to DU , with $p = m - 1$, we have

$$\|DU\|_{\mathbf{L}^\infty} \leq C \|DU\|_{\mathbf{L}^2}^{1-\frac{d}{2(m-1)}} \|D^m U\|_{\mathbf{L}^2}^{\frac{d}{2(m-1)}}.$$

In the same way as before, we obtain

$$\|DU\|_{\mathbf{L}^\infty} \leq C(1+t)^s Z$$

where

$$\begin{aligned} s &= -g_1 \left(1 - \frac{d}{2(m-1)}\right) - (g_1 + m - 1) \frac{d}{2(m-1)} \\ &= -g_1 - \frac{d}{2} = \beta. \end{aligned}$$

3. Applying Lemma 4.4 to $D^2 U$ with $p = m - 2$, which is possible since $m - 2 > d/2$, we finally prove the third inequality. \square

Lemma 4.6. *Let $f, \varphi \in \mathbf{H}^m \cap \mathbf{L}^\infty(\mathbb{R}^d)$, let $\alpha \in \mathbb{N}^d$ such that $|\alpha| = k \leq m$. Then*

$$\|\partial^\alpha(f\varphi)\|_{\mathbf{L}^2} \leq C(\|f\|_{\mathbf{L}^\infty} \|D^k \varphi\|_{\mathbf{L}^2} + \|\varphi\|_{\mathbf{L}^\infty} \|D^k f\|_{\mathbf{L}^2}).$$

Lemma 4.7. *Let $f \in (\mathbf{L}^\infty \cap \mathbf{H}^m)(\mathbb{R}^d)$. If $\nu \in \mathbb{N}$ and $\nu \geq 2$, or $\nu \in \mathbb{R}$ and $\nu \in [m, +\infty[$, we have $f^\nu \in \mathbf{H}^m(\mathbb{R}^d)$ and, for all $\alpha \in \mathbb{N}^d$ such that $|\alpha| = k \leq m$, we have*

$$\|\partial^\alpha f^\nu\|_{\mathbf{L}^2} \leq C \|f\|_{\mathbf{L}^\infty}^{\nu-1} \|D^k f\|_{\mathbf{L}^2}, \quad (4.3)$$

where $C > 0$ is a constant independent from f, α, ν .

Proof. For $\nu \in \mathbb{N}$, $\nu \geq 2$, we proceed by iteration on ν , using Lemma 4.6.

For $\nu \in [m, +\infty[$, we have

$$\partial^\alpha(f^\nu(x)) = \sum_{1 \leq j \leq k} \sum_{\substack{\beta_1 + \dots + \beta_j = \alpha \\ |\beta_i| = b_i \geq 1}} c_{\alpha, \beta} f^{\nu-j} \partial^{\beta_1} f \dots \partial^{\beta_j} f.$$

Then we take $\partial^{\beta_i} f \in \mathbf{L}^{2\frac{k}{b_i}}$, we apply Hölder inequality and Lemma 4.1 to obtain:

$$\begin{aligned} \|\partial^\alpha(f^\nu)\|_{\mathbf{L}^2} &\leq C \sum_{j=1}^k \|f^{\nu-j}\|_{\mathbf{L}^\infty} \prod_{\substack{i=1 \\ \sum b_i = k}}^j \|\partial^{\beta_i} f\|_{\mathbf{L}^{2\frac{k}{b_i}}} \\ &\leq C \sum_{j=1}^k \|f^{\nu-j}\|_{\mathbf{L}^\infty} \prod_{\substack{i=1 \\ \sum b_i = k}}^j \|f\|_{\mathbf{L}^\infty}^{1-b_i/k} \|D^k f\|_{\mathbf{L}^2}^{b_i/k} \\ &\leq C \|f\|_{\mathbf{L}^\infty}^{\nu-1} \|D^k f\|_{\mathbf{L}^2}, \end{aligned}$$

using besides that for all $j \in \llbracket 1, m \rrbracket$, $\|f^{\nu-j}\|_{\mathbf{L}^\infty} \leq \|f\|_{\mathbf{L}^\infty}^{\nu-j}$ since $\nu - j \geq 0$. \square
